SPECIFICATIONS

Format	Compact disc digital audio system
Audio section	
Frequency response	5-20kHz ±0.5dB
Total harmonic distortion	0.004%
Dynamic range	95dB
Output level	2V rms
Signal-to-noise ratio	-90dBV
Channel separation	90dB at 1kHz
Output impedance	600 ohms
Internal systems	
Optical pickup	3-beam laser
D/A conversion	16 bit linear
Filter	Seventh order passive filter
Error correction	CIRC dual error correction system
Fuctions	
Music search	SKIP buttons
Fast forward/reverse	FF and REV buttons
Remaining time display	REMAINING key
Program memory function	16 selections, random
Repeat	Repeat of one program Repeat of all contents
Disc loading	Motor driven, horizontal loading
General	
Power requirements	100-120V/220-240V, 50/60Hz
Power cunsumption	12W
Dimensions(wxhxd)	13-7/16" x 3-7/16" x 11-9/16" 341mm x 88mm x 293mm
Weight	7lbs. 5oz., 3.3kg
Accessories	Owner's manual Audio cable

CIRCUIT OPERATIONS

A. Laser pickup

The laser pickup used for the model CD-100X comprises six photo diodes A to F; diodes A to D, consisting actually of one single diode which is divided vertically and horizontally into four parts, for signal detection and diodes E and F for tracking servo.

Since the laser light scintillated onto the surface of compact disc is turbulently reflected by pit area and entirely reflected by no pit area, the digital signals in disc can be read out by detecting the reflected laser light.

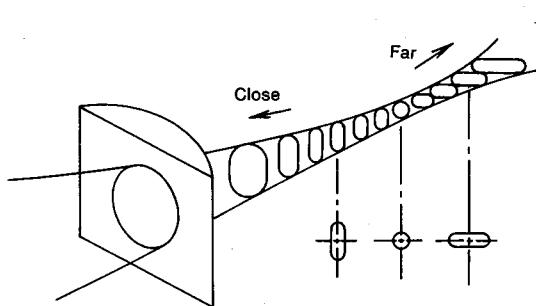

The signals detected by photo diodes A to D is sent to U101(CX20109); signals from A+C are to #5(PD1) pin and B+D to #6(PD2) of U101 to be summed and generate an EFM signal at #3(RFO) pin. The test point marked EYE TP is the check point for the EFM signal. The EFM signal input to #2(RFI) pin is shape out by the comparator in U101 to be binary signals. The reference voltage of the comparator, at #22(ASY) pin of U101, varies in accordance with the shape of CD pits. It drifts up and down to the shape of the disc pit which normally equals to be zero. The binary EFM signal is sent from #20(EFM) pin of U101 to #5(EFM) pin of U301(CX23035).

B. Servo system

The model CD-100X utilizes five servo circuits -- the focus servo, tracking servo, sled servo, laser output servo (APC) and CLV servo -- which are controlled by U303.

B-1 Focus control servo

The astigmatic method is employed for the focus control which utilizes the fact that routing the reflected laser light through a semi-cylindrical lens changes the shape of the beam in accordance with the distance.

The theory of the astigmatic method

Providing a focalization is made at the point which the beam becomes a true circle, an out-focus condition due to too far or too close situation can be detected since it varies the shape of the beam.

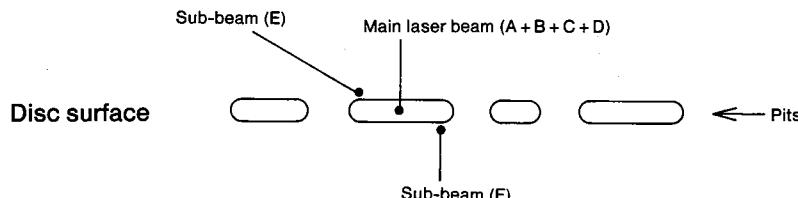

The focus servo circuit of the model CD-100X generates the difference $(A+C)-(B+D)$ from the laser pickup output signals (A+C) and (B+D). The focalization is perfect when this difference, the focus error signal, equals zero. U303 delivers the focus drive signal from the focus error signal which in turn applied to the tracking coil of the laser pickup to focalize. U303 sends this focus drive signal to the laser pickup from #21 pin(FEO). Q303 and Q304 amplify this signal and applies this signal

CIRCUIT OPERATIONS

to the laser pickup.

B-2 Tracking servo

Tracking servo is required to chase disc pit columns since CD systems do not have a guide to lead laser beam to the pit. The model CD-100X employs 3-beam tracking servo system.

The 3-beam tracking servo

Three laser beams are irradiated towards the pits in slightly offset intervals to each other as shown. Servo is achieved by the following fact that: where the main beam (indicated by point [A+B+C+D] above, is precisely on the pit, (E-F) is zero; otherwise not).

The E and F signals, input from #8(E) and #11(F) pins of U101, generate (E-F) signal inside and delivered at #17(TE) pin. RV101(E-F BALANCE) adjusts for the balance of E and F signals; RV301(RADIAL OFFSET) is for the offset adjustment; RV302(RADIAL GAIN) is for the servo gain adjustment. The TE(tracking error) signal from U101 enters into #13 pin(TE) and U303 makes tracking servo control signal according to the tracing error signal. The tracking servo control signal goes out of U303 from #27 pin (TAO) and Q307 and Q308 amplify to drive the tracking coil of the laser pickup.

In searching for a track the laser pickup should be moved quickly, U304(CPU) transmits data to pins #8(DATA) to #10(CLK) of U303 which in turn delivers the pulse from pin #27(TAO) in accordance with the corresponding pulse width.

B-3 Sled servo

The sled servo serves for dual purpose -- to gradually move back and forth the entirety of the laser pickup in accordance with the procession of disc playing; and to move it quickly for searching tracks.

The lens of the laser pickup is able to travel at a small distance to follow the pits when playing with the entire pickup stopped. As it approaches the limit of the travelable range, DC components come to be contained in the tracking servo signals. The sled servo acts to detect the DC components and maintains the lens to be in the middle of the moveable range, namely to maintain the DC component to be zero.

The fraction of tracking servo signal from pin #27(TAO) of U303 through Q307 and Q308, only the DC component is extracted by R353, R354, C326, and C327 and applied to pin #25(SL+) of U303. This DC component is amplified in U303 and buffered by Q305 and Q306 and finally drives the sled motor. In regular operation, 0 to 0.4V DC is applied to rotate the sled motor every several seconds.

The sled motor is energized by the plus or minus DC at pin #23(SLO) of U303 corresponding to data from the CPU during searching the tracks.

B-4 APC(Auto Power Controller) circuit

The APC circuit is provided to maintain the constant laser output level in spite of the variation in temperature etc.

The monitor diode located in the close proximity of the lens feeds back the variation

CIRCUIT OPERATIONS

to keep the current flowing through the diode constant. The feed back voltage from the monitor diode is compared to reference voltage by U306. Q601 amplifies its output and applies to laser emission diode to control laser output. An "high" status of pin #57(LASER) of U304 turns Q603 off and in turn Q602 on so that the output of U304 connected to ground. Therefore laser diode turns off.

Important note for servicing

To avoid burning out the laser diode, the APC connector shall not be disconnected whichever the power is on or off.

Before removing connector CN601 for servicing, be sure to solder on the shorting terminals on the laser head to short them out. While to assemble the head, first connect the CN601 to the pc board then open the terminals on the head and turn the power on. (The terminals can be accessed without removing the bottom plate of the unit by peeling the black sealing off.)

To determine the failure of the laser head, sizing the voltage across the head can be a key. Connect a digital voltmeter across R602 and press the PLAY button. The current (I) can be calculated as:

$$I = \text{Voltage across R602} / 22 \text{ (ohm)}$$

The laser head is normal if I is obtained within 10% of the value specified on the individual head. But I shows tendency to increase when the laser pickup is used over 1000 hours.

15556	---	69.4mA
694		

B-5 CLV (Constant Linear Velocity) servo circuit

Unlike analog records, the rotation of compact disc is 500rpm in inner area and 200rpm in outer area. The CLV servo acts to maintain the proper rotation of the motor. The reference to determine if the rotation is too fast or too slow depends upon the coincidence of the phase of the RF signal to U301 and the reference clock signal. The correct motor rotation causes a 50% duty signal delivered at pin #3(MDP) of U301; while a faster rotation causes a longer duty signal (a signal with the long "high" period of time); a slower rotation causes a shorter duty signal to be delivered. This signal is amplified by U305(1/2, 2/2), Q301, and Q302 and finally drives the spindle motor.

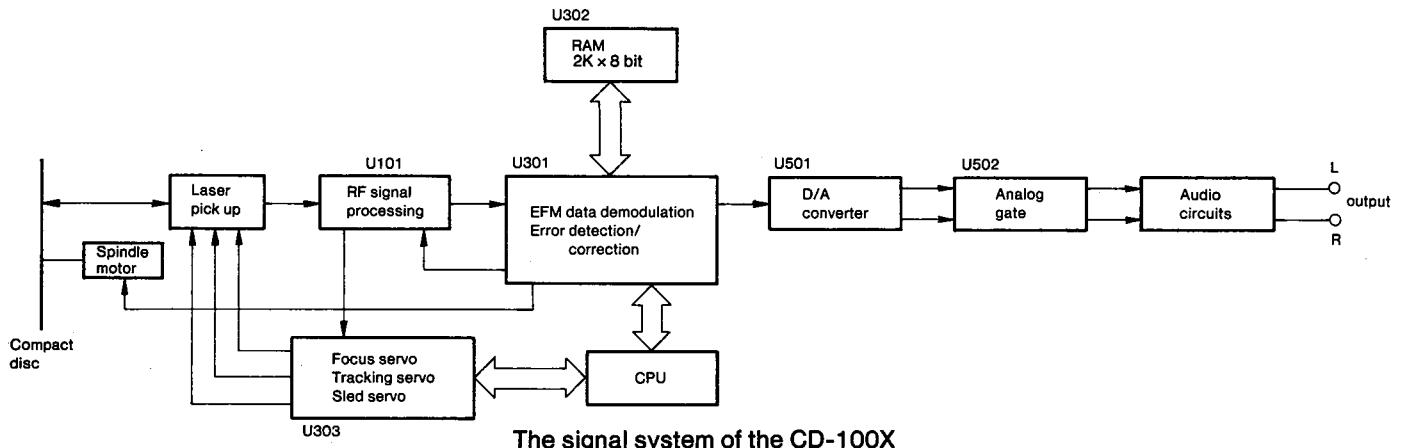

C. Signal system

The signals detected by the laser pickup are applied to U101 -- (A+C) to #5 pin(PD1); (B+D) to #6 pin(PD2) -- and generated as EFM signal of (A+B+C+D) and output at pin #3(RFO). The EFM signal is input to pin #2 and to the comparator inside U101 which rejects DC components from the EFM signal to an asymmetrical configuration so that convert it to the binary signal.

The EFM signal then input to pin #5(EFM) of U301 which serves to the demodulation of EFM data, reproduction of bit clock, error detection/correction, data interpolation, and sub-code demodulation, etc. Since to read out the data input to pin #5(EFM) of U301, the clock should be reproduced the discrete VCO(Voltage Controlled Oscillator)

CIRCUIT OPERATIONS

is used. The VCO clock frequency and EFM waveform are compared with each other in the phase comparator of U301 and the difference, if found, is delivered to pin #11(PDO) and filtered to be the smooth DC inside U301 finally controlling the VCO frequency determined by L301, D301 and D302. This chain of PLL (Phase Locked Loop) circuit reproduces the bit clock, 4.32MHz.

The reproduction of bit clock causes the demodulation of the EFM signal into digital data inside U301, and sending the demodulated data to store it in the RAM(U302). Should an error be found in the demodulated data, the stored data is recalled from the RAM for correction and interpolation and the correct data is sent pins #76(DA14) to #80(LRCK) of U301.

U501 is an integral type DAC(Digital-Analog Converter) which converts the clock and digital data input from pins #6(LATCH) to #10(DIN) into analog signals. This IC executes the D/A conversion on left and right channels alternatively. At the moment the integration for the D/A conversion is finished, current flows through analog switch U502 and input to U504. At next moment, Q501 or Q502 turns on and U501 resumes the D/A conversion again. Through the repetition of above process the digital data is transformed to the analog signals which in turn filtered into a smooth audio signal.

Q501 and Q502 are controlled by the CPU and switch to vary the response of the filter when the high frequency range of disc is emphasized. Q505 and Q506 are muting transistors for audio signals. At power turning on Q508 turns on and Q505 and Q506 are on, and the audio is muted. After 1 seconds since the power turning on, the level of pin #56(P-MUTE) of U304 is "high", Q507 turns off, cancelling the mute. At power turning off, Q508 base is "low" by the action of U307, Q505 and Q506R are on, muting the audio.

D. Control system

U304 serves as the system controller for the model CD-100x. It exchanges data with the servo and signal systems to control the other stages, while controlling the functional controls and indicators. For the basic information, see page 17.

E Power supply

The power supply circuit comprising Q803 and Q804 feeds power to analog circuit comprising U503 to U505, comparator, loading amp U307 and CLV amp U305. Q801 is the regulated supply for +8V, while Q802 is for -8V. Q805 and Q806 feeds with ±5V power to all ICs other than above.

DISASSEMBLY/ASSEMBLY PROCEDURE

1. Disassembly

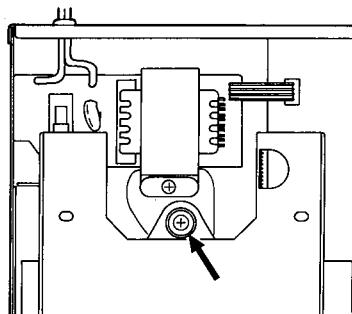

A. Top cover removal

- (1) Remove four screws which fix the top cover on the chassis.
- (2) Pull the cover backward.

B. Disc mechanism removal

- (1) Remove the top cover.
- (2) Remove two screws on the bottom which fix the disc mechanism.
- (3) Remove a screw at the back of the disc mechanism. (fig.1)
- (4) Remove five cables from the mechanism to the main pc board.
- (5) Pull the mechanism backward gently.

Fig. 1
Disc mechanism
top view

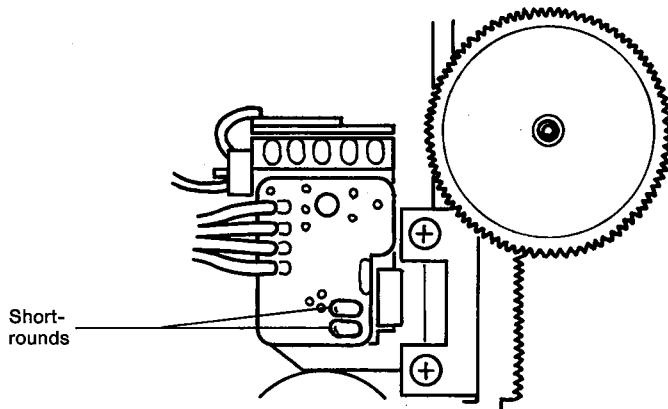

CAUTION !

After disc mechanism removal, short the short-rounds on the laser pickup to protect it from static. (fig. 2.) Use a solder iron which has little leak current (e.g. with ceramic heaters).

Do not remove the connector CN601 while shorting and opening the short-rounds!

Do not touch the laser pickup when the short-rounds is not shorted!

The bottom of the laser pickup

Fig. 2

DISASSEMBLY/ASSEMBLY PROCEDURE

C. Front panel removal

- (1) Remove the top cover.
- (2) Remove four screws which fix the front panel on the chassis.
- (3) Pull the panel forward pushing sides outside.
- (4) Remove four cables from the panel to the main pc board (CN307 - CN310). (fig. 3, 4)
To remove cables from connectors push the top of connector while pulling a cable.
Be sure not to add unnatural force to indicators when you asswmble the front panel.

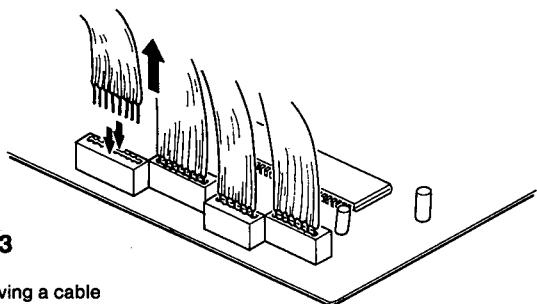

Fig. 3

Removing a cable
from a connector.

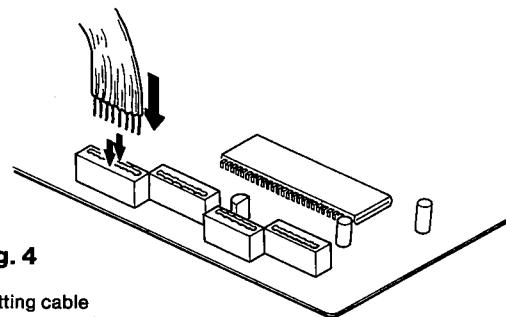

Fig. 4

Putting cable
into a connector.

D. Main pc board removal

- (1) Remove the top cover.
- (2) Remove a screw on the rear panel which fixes the OUTPUT jacks on the rear panel.
- (3) Remove two screws which fix the board on the chassis.
- (4) Remove all connectors from the board.

E. Power supply unit removal

- (1) Remove the top cover.
- (2) Remove all the cables from this board to the main PC board.
- (3) Remove two screws which fix the power transformer on the chassis.
- (4) Remove the AC power cord from the board.

F. Switch pc board removal

- (1) Remove the top cover.
- (2) Remove two screws which fix the board on the front panel.
- (3) Remove the board pushing six retainers outside. (fig. 5)
- (4) Remove four cables from the board to the main pc board.

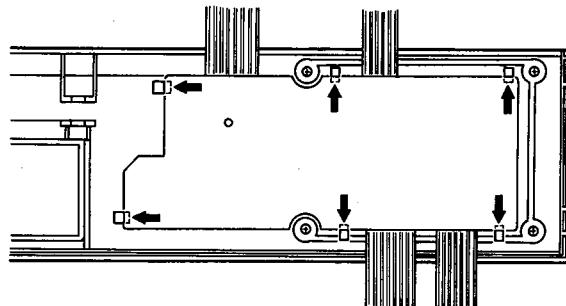

Fig. 5

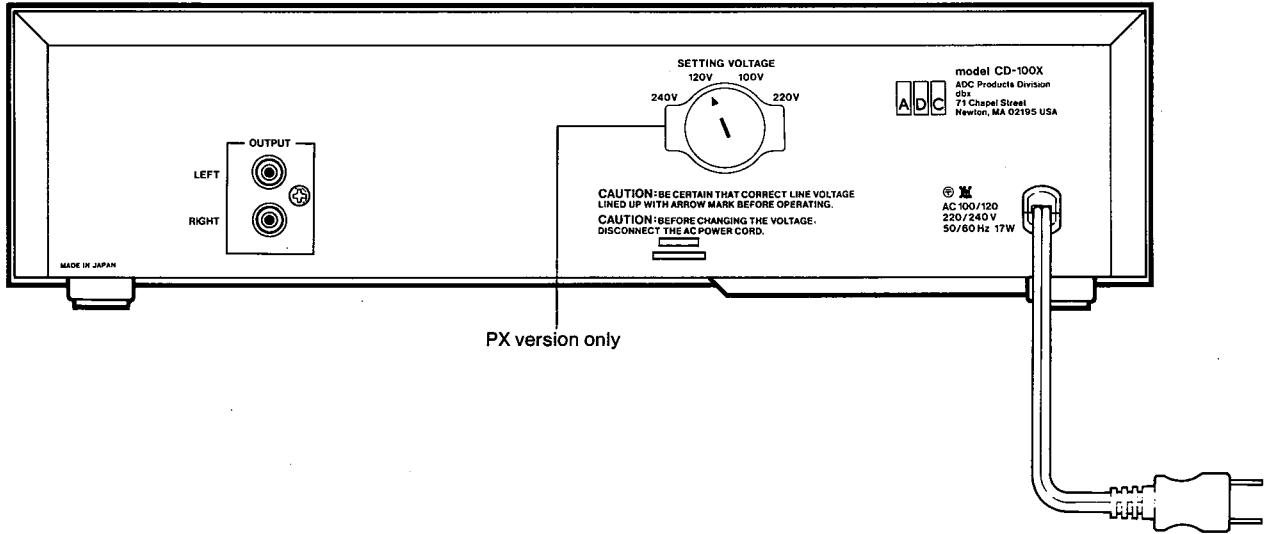

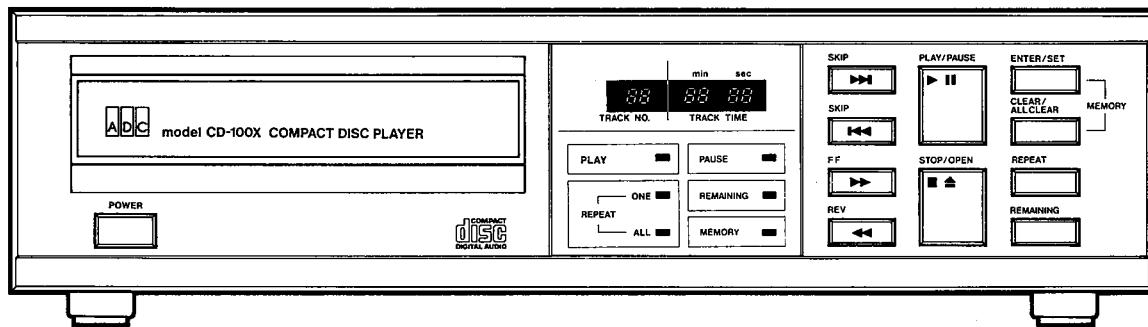

DISASSEMBLY/ASSEMBLY PROCEDURE

2. Assembly

To assemble parts, make reverse manner of disassembly procedure basically. But to assemble the disc mechanism, follow the procedure below.

- (1) Connect the connector marked CN601(black) to connectors on the main PC board.
- (2) Open the short-round on the laser pickup.
- (3) Insert floating bracket at the front of the disc mechanism to the front panel.
- (4) Screw the rear of the disc mechanism on the chassis.
- (5) Connect other cables to connectors on the main pc board.

Note: It is very important to keep the order of the above procedure.

ADJUSTMENT PROCEDURE

Before adjustment

- Allow a minimum of 10 minutes warm-up for the test equipments and the unit under test.
- Maintain rated ac line voltage.
- Before adjustment, confirm that the regulated $\pm 5\text{Vdc}$, $\pm 8\text{Vdc}$, $\pm 16\text{Vdc}$, -24Vdc power supplies operate correctly.

Instruments required

- Oscilloscope
- Frequency counter
- Test disc; Sony Type 4 (YEDS-18)

A. To introduce the test mode

The test mode is introduced by grounding the test point, marked CHECK MODE on the main pc board, during the power is off or disc tray is open (out).

B. Tracking offset adjustment

- (1) Connect scope to test point TRACKING and to ground.
- (2) Set the unit to the check mode, see procedure A above, and turn the power on.
- (3) Without disc loaded or in standby condition, adjust RV302 for $\pm 0\text{V}$ on scope.

C. PLL frequency adjustment/Lock frequency check

- (1) Ground test point ASY.
- (2) Connect frequency counter to test point PLL and to ground.
- (3) Turn the power on and adjust RV303 for 0V at J301(VCO).
- (4) Adjust L301 for 4.3000MHz on the counter.
- (5) Disconnect test point ASY from ground.
- (6) Load with test disc YEDS-18 and press the PLAY button.
- (7) Check counter reads 4.3218MHz.

D. Focus offset adjustment.

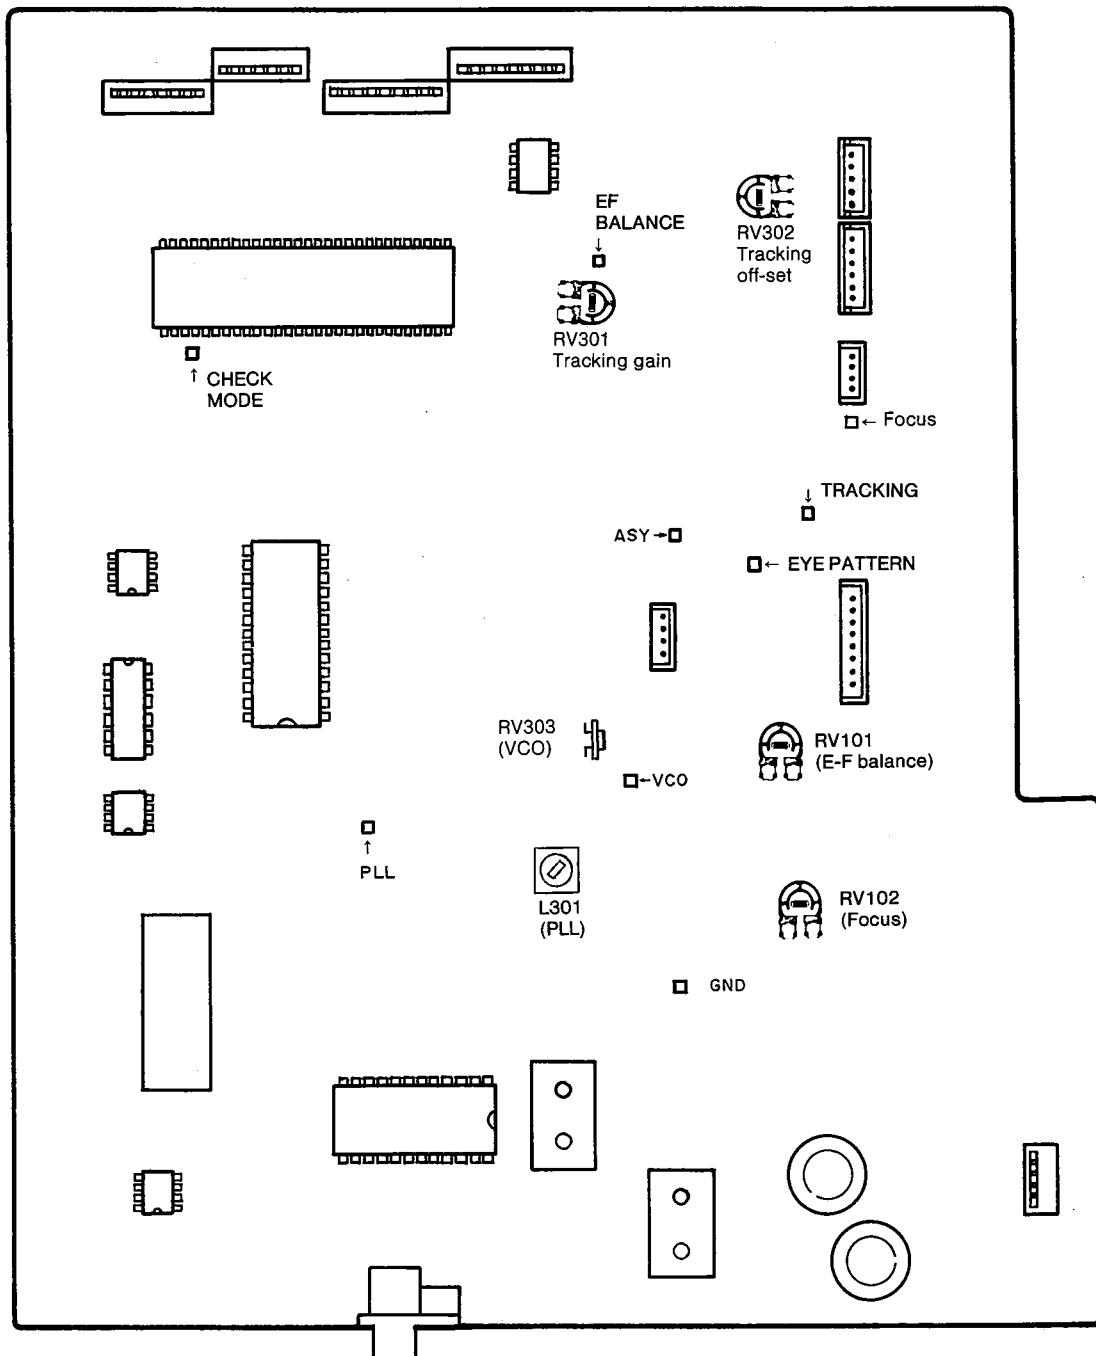

- (1) Connect scope to test point EYE PATTERN and to ground.
- (2) Load with disc YEDS-18 and press the PLAY button.
- (3) Adjust RV102 for the view on scope which follows:
(Adjust for a clear, distinct shape of the diapers.)

E. E-F balance adjustment

- (1) Connect scope to test point EF BALANCE and to ground.
- (2) Turn the power on.
- (3) Load with test disc YEDS-18 and press the PLAY button.
- (4) Mark the position of RV301 and turn RV301 to full clockwise.
- (5) Adjust RV101 so that the signal has the symmetrical plus swing and minus swing on scope. Enlarge the waveform for accurate adjustment.
- (6) Reset RV301 to original position.

ADJUSTMENT POINT

Main PC board

TEST PROCEDURE

A. Power turning on test

Note: Unless otherwise noted, the model CD-100X is referred to as "the unit".

- (1) Plug the power cord form the unit to specific power supply.
- (2) Depress the POWER button of the unit. No significant noise or audible hum shall be apparent.

Note: The unit maintains above condition even the tray is open (out).

B. Loading test

- (1) Operate the STOP/OPEN button to open or close the disc tray. No mechanical noise shall be present.
- (2) The tray shall be open (out) when the STOP/OPEN button is depressed during the tray is closed (in).
- (3) The tray shall be close (in) when the STOP/OPEN button is depressed during the tray is open (out).
- (4) The unit shall be in the stop mode when the STOP/OPEN button is pressed during playback. Another pressing of the STOP/OPEN button shall open the tray (out).

C. Lead-in test

- (1) Operate the STOP/OPEN button to open the disc tray. Put a disc in the tray.
- (2) Press the STOP/OPEN, PLAY or PAUSE button. The drawer closes and the player starts "lead-in". During "lead-in", the TRACK NO. "1" shall be indicated.
- (3) Lead-in is void if the disc loaded up-side down. In this case, the drawer opens after 12 seconds.

D. Play test (the PLAY indicator lights up)

- (1) Press the PLAY button after placing the disc on the tray. After confirming the disc is loaded, the unit shall commence to lead-in then play.
- (2) The unit shall play the track which is assigned by the Forward SKIP/Reverse SKIP button after set to play mode. The unit operates in the same manner when the track is assigned in prior to lead-in, however, if assigned track number is greater than the number actually contained in the disc, the player plays the last track. When no lead-in data is found, the disc drawer opens after approx. 12 seconds.
- (3) The TRACK NO. indicator shows the number of the track during searching the beginning of the program then set to the counter mode after the track has been searched.
- (4) Pressing the SKIP button during playing allows to search for the beginning of the track being played and resumes playing.
- (5) The playing shall be free of intermittent sound, noises, or distortion.
- (6) Pressing the PLAY button shall cause the PLAY indicator to light up.

E. SKIP test

- (1) The SKIP buttons allow the unit to accept up to 99 tracks before lead-in.
- (2) The SKIP button allows the unit to accept the number of tracks actually contained in the disc after lead-in.
- (3) After searching the beginning of a track, during playback, pressing the SKIP

TEST PROCEDURE

buttons allows an immediate start of play.

- (4) Pressing the SKIP buttons during stop will not allow to start playing.
- (5) The operation of the SKIP buttons during the memory-play allows to play the tracks in the order that have been stored in the memory.
- (6) Pressing the SKIP (reverse) button during playing causes to play the beginning of the track being played, not the track located before it.

F. FF/REV test

- (1) Pressing the FF or REV button during playing or pause allows a fast-forwarding or reverse. Since the forwarding or reverse done in the pause mode is faster 10 to 20 times than the normal play, the playing sound is not heard. This feature allows to reach the desired selection in a short time period.
- (2) Operating the FF/REV mode during the memory-play allows to fast-forward or reverse to the tracks stored in the memory.

G. PAUSE test (the PAUSE indicator lights up)

- (1) Pressing the PAUSE button causes the PAUSE indicator to light up, stops the TRACK TIME counter, and deactivates the sound output.
- (2) In the pause mode, pressing the PLAY/PAUSE button again allows the playing to resume.

H. STOP test

- (1) Pressing the STOP button during play allows the unit to be in standby mode.
- (2) While the unit is in operation after the lead-in, the STOP button overrides any function of the unit and stops any motion.

I. MEMORY CLEAR test

- (1) To clear the memory, the CLEAR/ALL button shall be pressed once while the TRACK NO. indicator lights up continuously (5 seconds) and the track entered just before is erased.
- (2) Pressing the CLEAR/ALL button twice in sequence clears all the memory contents.

J. Memory test (the MEMORY indicator lights up)

This feature allows to play any desired track, up to 16, in any desired sequence after having them entered in the memory. The memory entry is possible in stop, play, or pause mode after lead-in.

- (1) Pressing the ENTER/SET button causes the TRACK NO. indicator to blink which shows the unit is now in the enter mode and ready to accept the memory entry. (Pressing the ENTER/SET button in the enter mode lets the blinking track number to be stored in the memory.)
- (2) The selection of the track to be stored is made on the SKIP button. Pressing the ENTER/SET button allows to memorize the track whose number is blinking in the indicator and lights up continuously for approx. five seconds until next entry (SKIP buttons) is made, then resumes blinking.
- (3) Perform above procedures to store the other track desired.

TEST PROCEDURE

- (4) The memory can accommodate the maximum of 16 tracks stored. If the ENTER/SET button is pressed after having stored 16 tracks, the blinking of the TRACK NO. indicator will not cease.
- (5) Pressing the PLAY button allows to commence to play the memory tracks, from the track stored first, and let the MEMORY indicator to light which shows the unit is now in the memory play mode.
- (6) The SKIP buttons allow to skip over to any memory tracks, one after another, during playing. Using the all repeat mode with the SKIP buttons allows an "endless search" as follows.

E.g. When tracks 1,3, and 5 are stored in the memory in that order.

- When not using a repeat or in REPEAT ONE mode;
The skip operation is possible between tracks 1 and 3; and tracks 3 and 5 (the forward SKIP button is inoperative on track 5. Likewise the reverse SKIP button is inoperative on track 1).
- In all repeat (REPEAT ALL) mode;
The skip motion is possible over the loop of 1, 3, 5, 1, 3,... etc. or vice versa. (Referred to as an "endless search".)
- (7) During memory play, the FF/REV motion is operative within the track being played. If the FF/REV button is operated beyond the range of the track being played, the search is made to the next memory track when the FF/REV button is released.
- (8) The REMAINING button is deactivated during the memory play.

To recall memory:

- (1) Playing -- Skip possible over memory tracks, then playing commences.
- (2) In pause -- Skip possible over memory tracks, then set to pause.
- (3) In stop -- Skip possible over memory tracks, then set to play if the PLAY button is pressed.

To clear memory:

- (1) Pressing the CLEAR/ALL CLEAR button while the TRACK NO. indicator lights up continuously) allows to erase the track entered just before.
- (2) Pressing the CLEAR/ ALL CLEAR button twice allows the erasure of all the memory contents and cancels the memory-entering mode (the TRACK NO. indicator lights up continuosly).
- (3) Pressing the CLEAR/ ALL CLEAR button twice during memory play mode allows to cancel the memory play mode and the unit is set to the normal play, extinguishing the MEMORY indicator.

K. Repeat test (ONE/ALL indicator lights up)

- (1) Pressing the REPEAT button once, lighting the REPEAT ONE indicator, introduces the one-track repeat mode.
- (2) Pressing the REPEAT button again, lighting the REPEAT ALL indicator, introduces the all-track repeat mode.
- (3) To deactivate the repeat mode, press the REPEAT button (third time press) to extinguish the indicator.

L. Remaining indicator test

- (1) Pressing the REMAINING button lets the indicator show the remaining time and minus(-) mark for approx. two seconds after this button is released.
- (2) The remaining time indicator counts down in minus every second during playing.

TEST PROCEDURE

(3) The REMAINING button is inoperative during the memory play.

M. Disc simulation test

Test disc to be used:

Philips, test Disc No. 814, 125-2, 5A

(1) Interruption [Track No. 9]

No inturmittence of sound shall apparent in 600 micrometer.

Note: Intermittence of sound beyond 600 micrometer is acceptable.

(2) Black dot [Track No. 17]

No intermittence of sound shall apparent in 500 micrometer.

(3) Finger print [Track No. 18, 19]

Simulated finger print shall not cause any intermittence of sound.

N. Eccentricity of disc

Test disc to be used:

Sony, Demonstration Vol. 2, processed for $\pm 0.15\text{mm}$ eccentricity

Searching for the beginning of each track shall be made properly. No intermittence of sound, no pickup skip, etc. shall be apparent.

O. Shock test

Test condition:

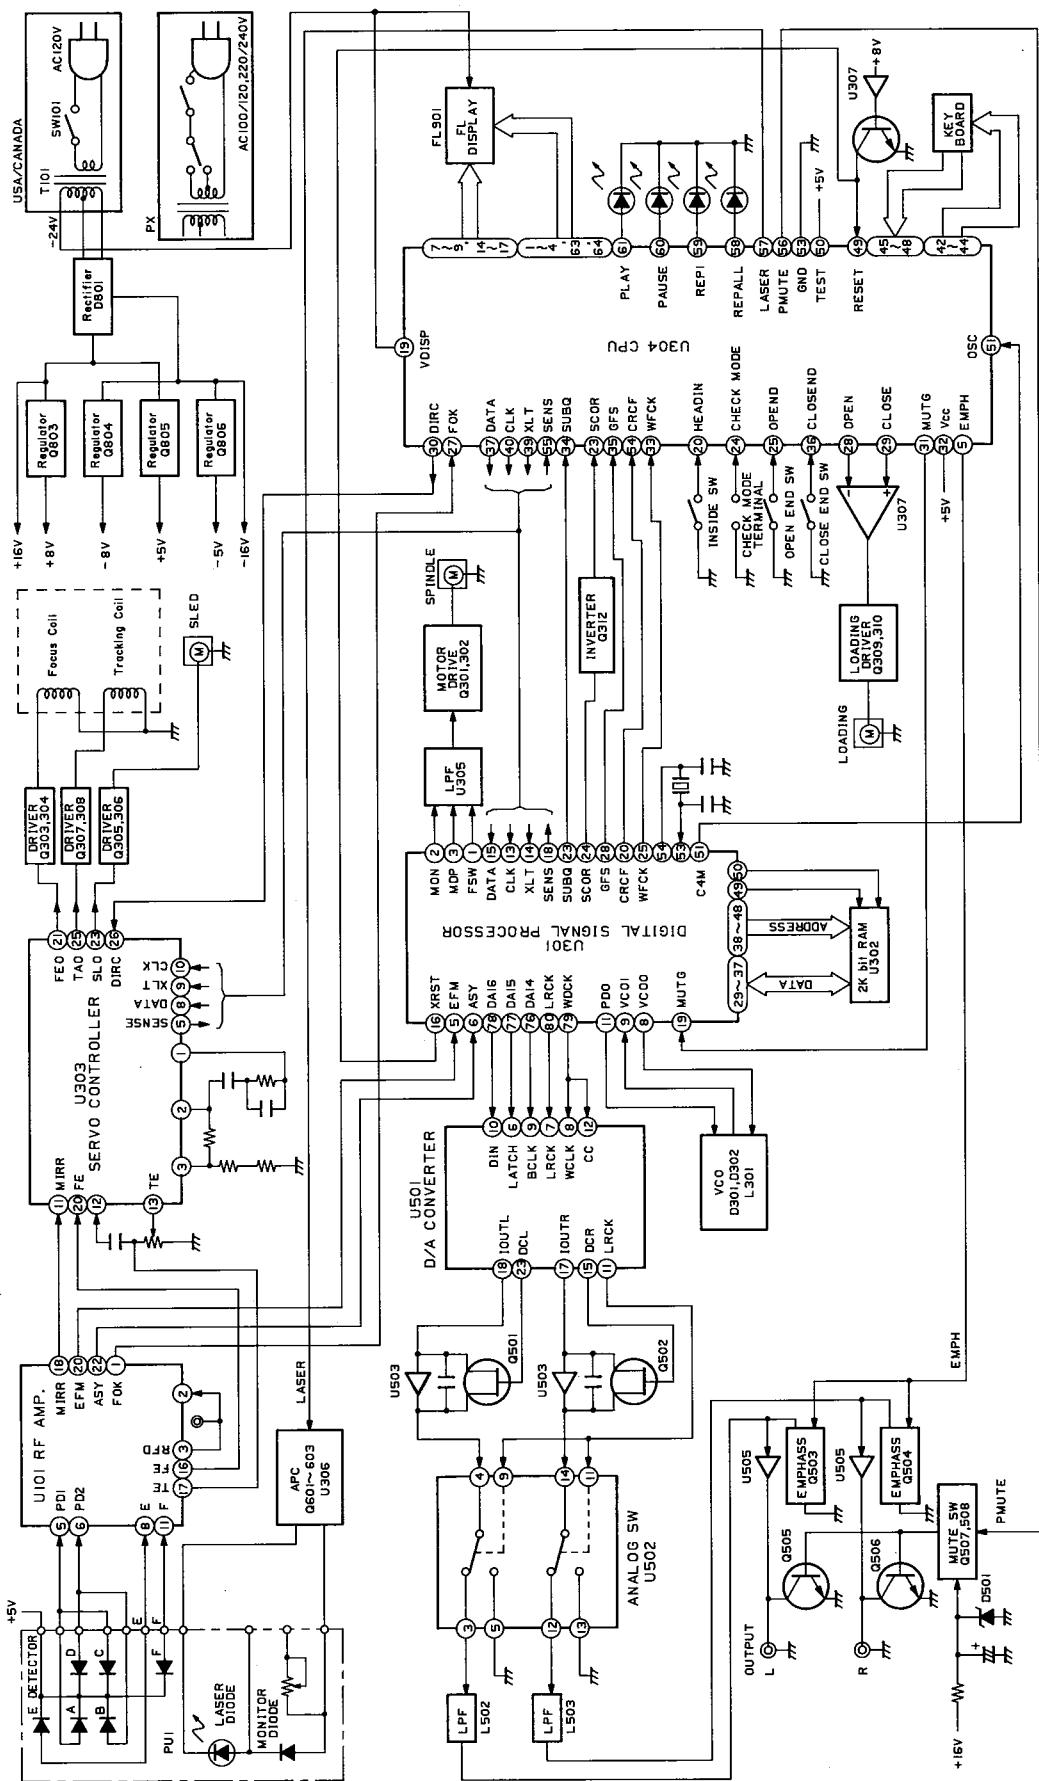

Test ball; 2cm diameter, 4g weight, to be free-dropped from the height of 20cm onto the any part of the top cover.

Test disc to be used:

Philips, Test Disc No. 814, 125-2, 5A, track No.2

No intermittence of sound, no pickup skip, etc. shall be apparent.

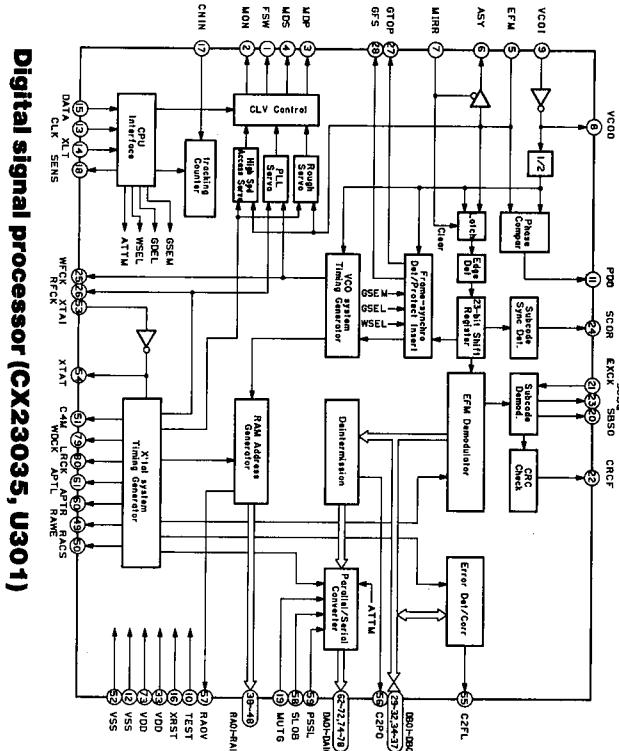

BLOCK DIAGRAM

IC DESCRIPTION

CPU (U304, HMCS404C) function table

Pin No.	Signal Name	I/O	Description
1	DIG3	0	Display digit data
2	DIG4	0	Display digit data
3	DIG5	0	Display digit data
4	DIG6	0	Display digit data
5	EMPH	0	If disc data is emphasized, this signal becomes high automatically.
6	SIG1	0	Not used
7	SIG2	0	Display segment data
8	SIG3	0	Display segment data
9	SIG4	0	Display segment data
10	SIG5	0	Display segment data
11	SIG6	0	Display segment data
12	SIG7	0	Display segment data
13	SIG8	0	Not used
14	SEG4	0	Display segment data
15	SEG5	0	Display segment data
16	SEG6	0	Display segment data
17	SEG7	0	Display segment data
18	WFCK	0	7.35kHz clock
19	WDISP	0	-22V
20	HEADIN	0	If the pickup goes to the inner limit SW, this signal becomes low.
21	---	---	Not used
22	---	---	Not used
23	SCOR	1	This terminal should be low for test mode.
24	TEST	1	When the disc tray fully opens, this signal becomes low.
25	OPENEND	1	Becomes low to light the MEMORY LED.
26	MEMLED	0	If focus is in, this signal becomes high.
27	POK	0	When this signal is low and CLOSE signal is high, the disc tray opens. When this signal is high and CLOSE signal is low, the tray closes. In the PLAY mode, both are high.
28	OPEN	0	Controls the pickup for direct track selection.
29	CLOSE	0	Becomes high to mute the digital line.
30	DIRC	0	+5V
31	MUTG	0	7.35kHz clock
32	VCC	0	Subcode data input
33	WFCK	0	When the U301 reads data normally, this becomes high. If this becomes low for 5 sec. the CPU judges the disc is bad and opens the tray.
34	SUBQ	0	When the tray closes completely, this becomes low.
35	GPS	0	Servo control signal for U301, U303.
36	CLSEND	1	Keyboard return signal.
37	DATA	0	Servo control signal for U301, U303.
38	---	---	Not used.
39	XLT	1	Servo control clock for U301, U303.
40	CLK	0	Keyboard scan signal.
41	SCAN1	0	Keyboard scan signal.
42	SCAN2	0	Keyboard scan signal.
43	SCAN3	0	Keyboard scan signal.
44	SCAN4	0	Keyboard scan signal.
45	RET1	1	Keyboard return signal.
46	RET2	1	Keyboard return signal.
47	RET3	1	Keyboard return signal.
48	RET4	1	Keyboard return signal.
49	RESET	1	Reset input signal.
50	TEST	1	Becomes high for test mode.
51	OSC1	51	CPU clock, 4.235MHz.
52	OSC2	52	Not used.
53	GND	53	Ground terminal.
54	CRCF	54	Becomes high when the CRC check.
55	SENSE	55	Internal status of the U301, U303.
56	PMUTE	56	Becomes high to mute the signal when the power is on. After 3 sec. this becomes low.
57	LASER	57	Becomes high when the laser is on.
58	REPAIL	58	Becomes high to light the ALL REPEAT LED.
59	REPL	59	Becomes high to light the REPEAT ONE LED.
60	PAUSE	60	Becomes high to light the PAUSE LED.

SCHEMATIC DIAGRAM

Safety precaution to service personnel

(1) Δ Safety requirement components in accordance with present safety regulations. These components must only be replaced by original components.

(2) To comply with present safety regulations be sure to make leakage current or resistance measurements before returning the appliance to customer.

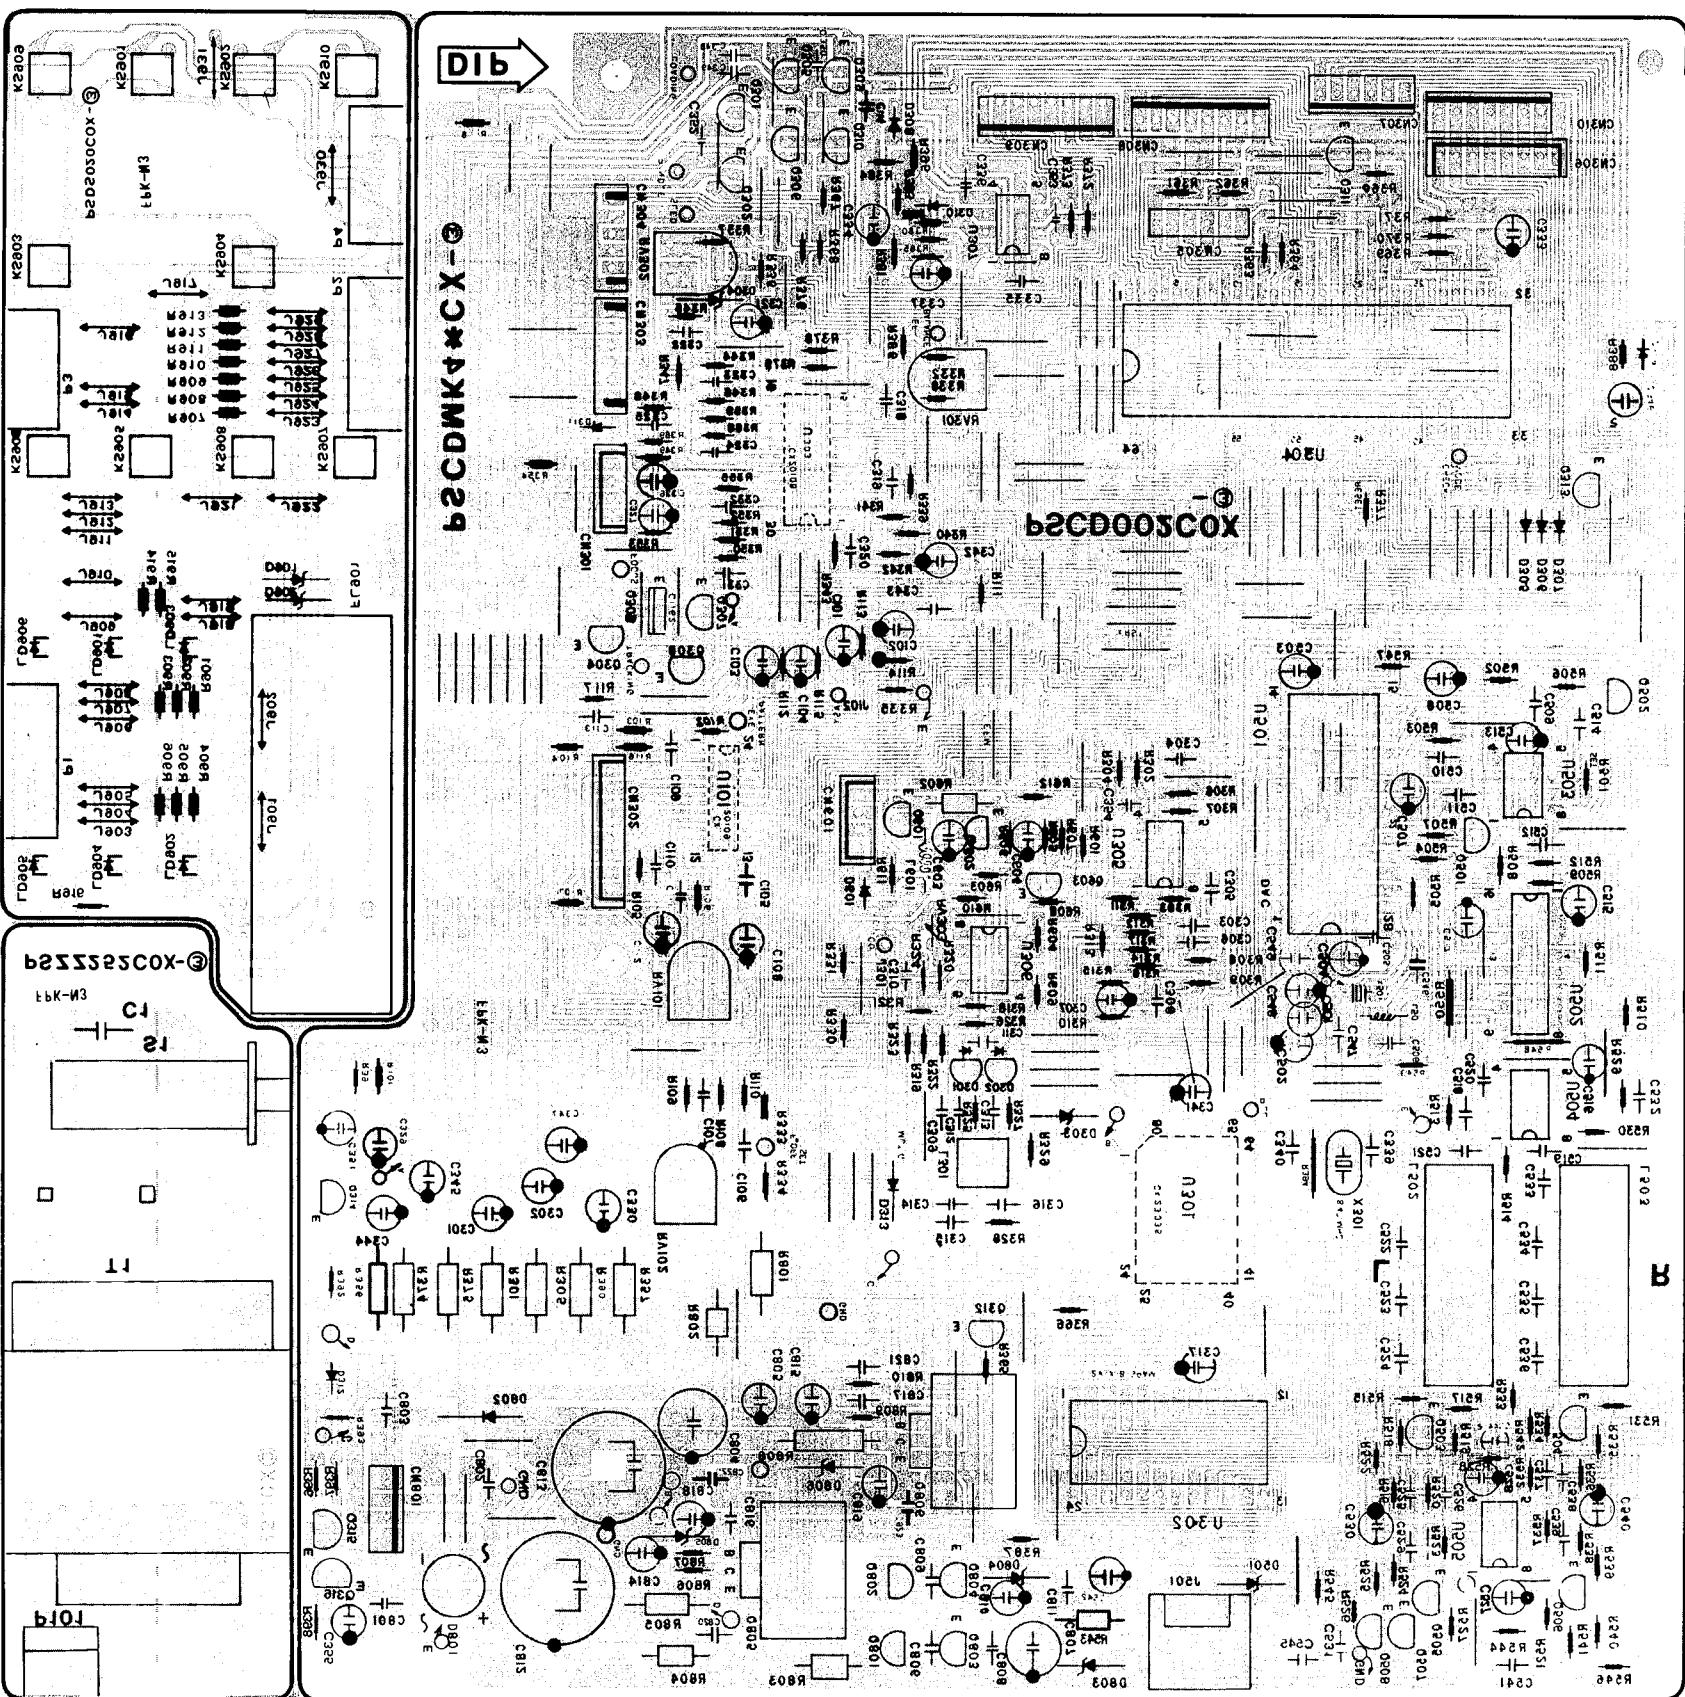

Note

All resistors are 1/4 watt unless otherwise noted.

Resistor values are in ohm ($1\text{K} = 1000 \text{ ohm}$).

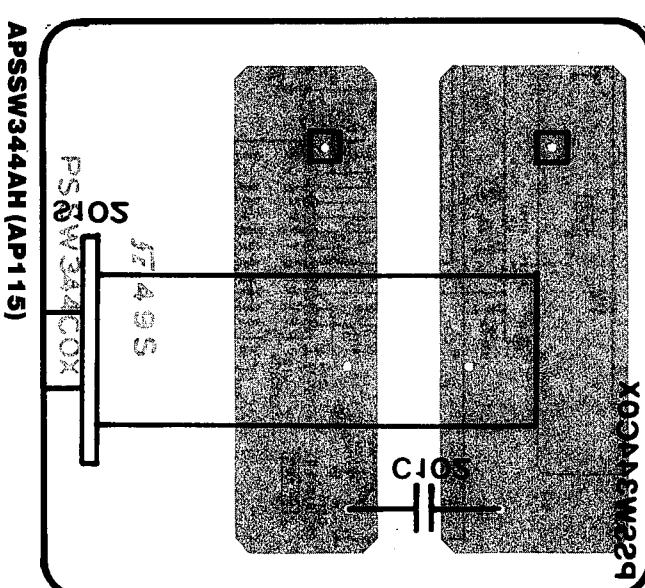

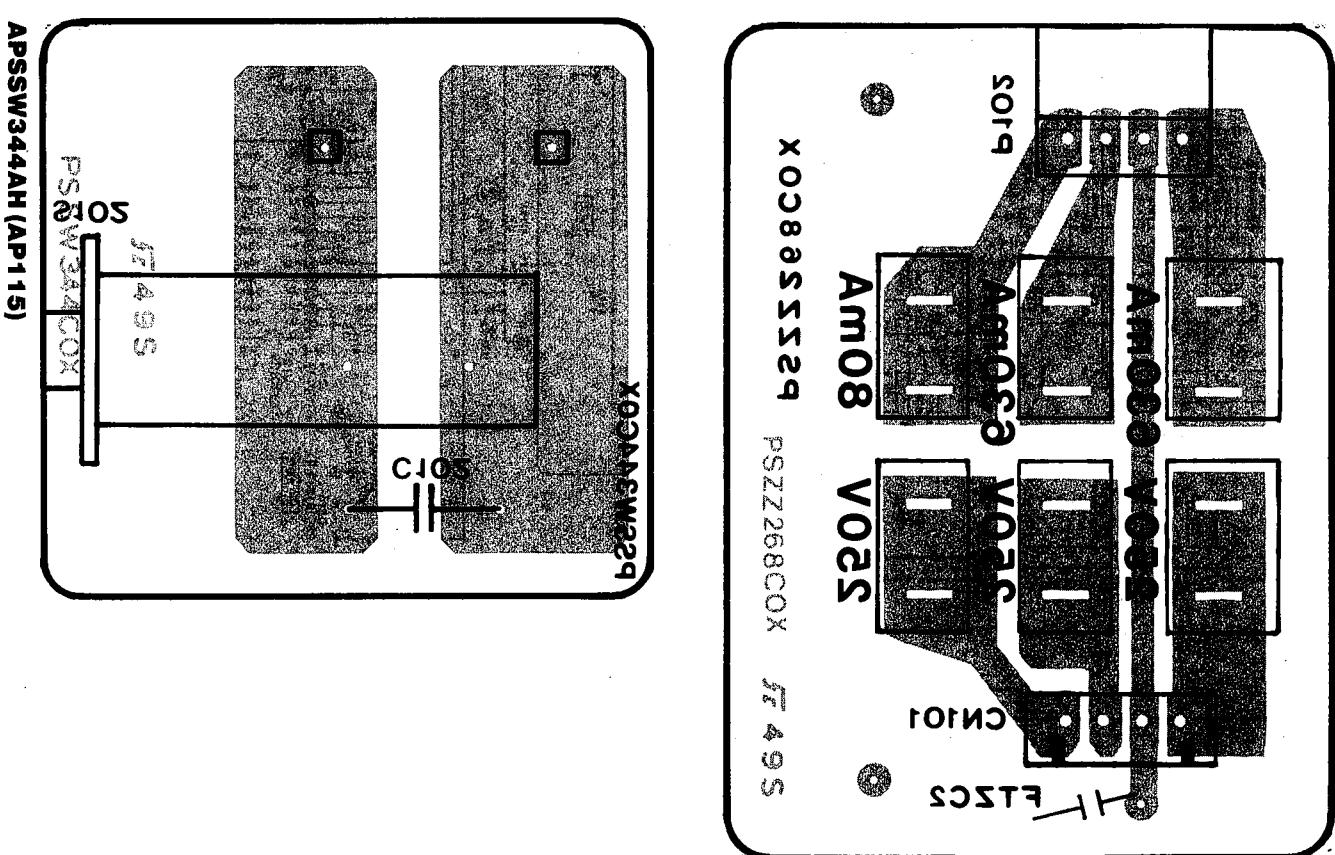

All capacitor values are in micro-farad ($\mu\text{F} = \text{pico-farad}$).

All voltages, read from chassis, are measured with VTVM under no signal conditions unless otherwise noted.

9. TRACKING

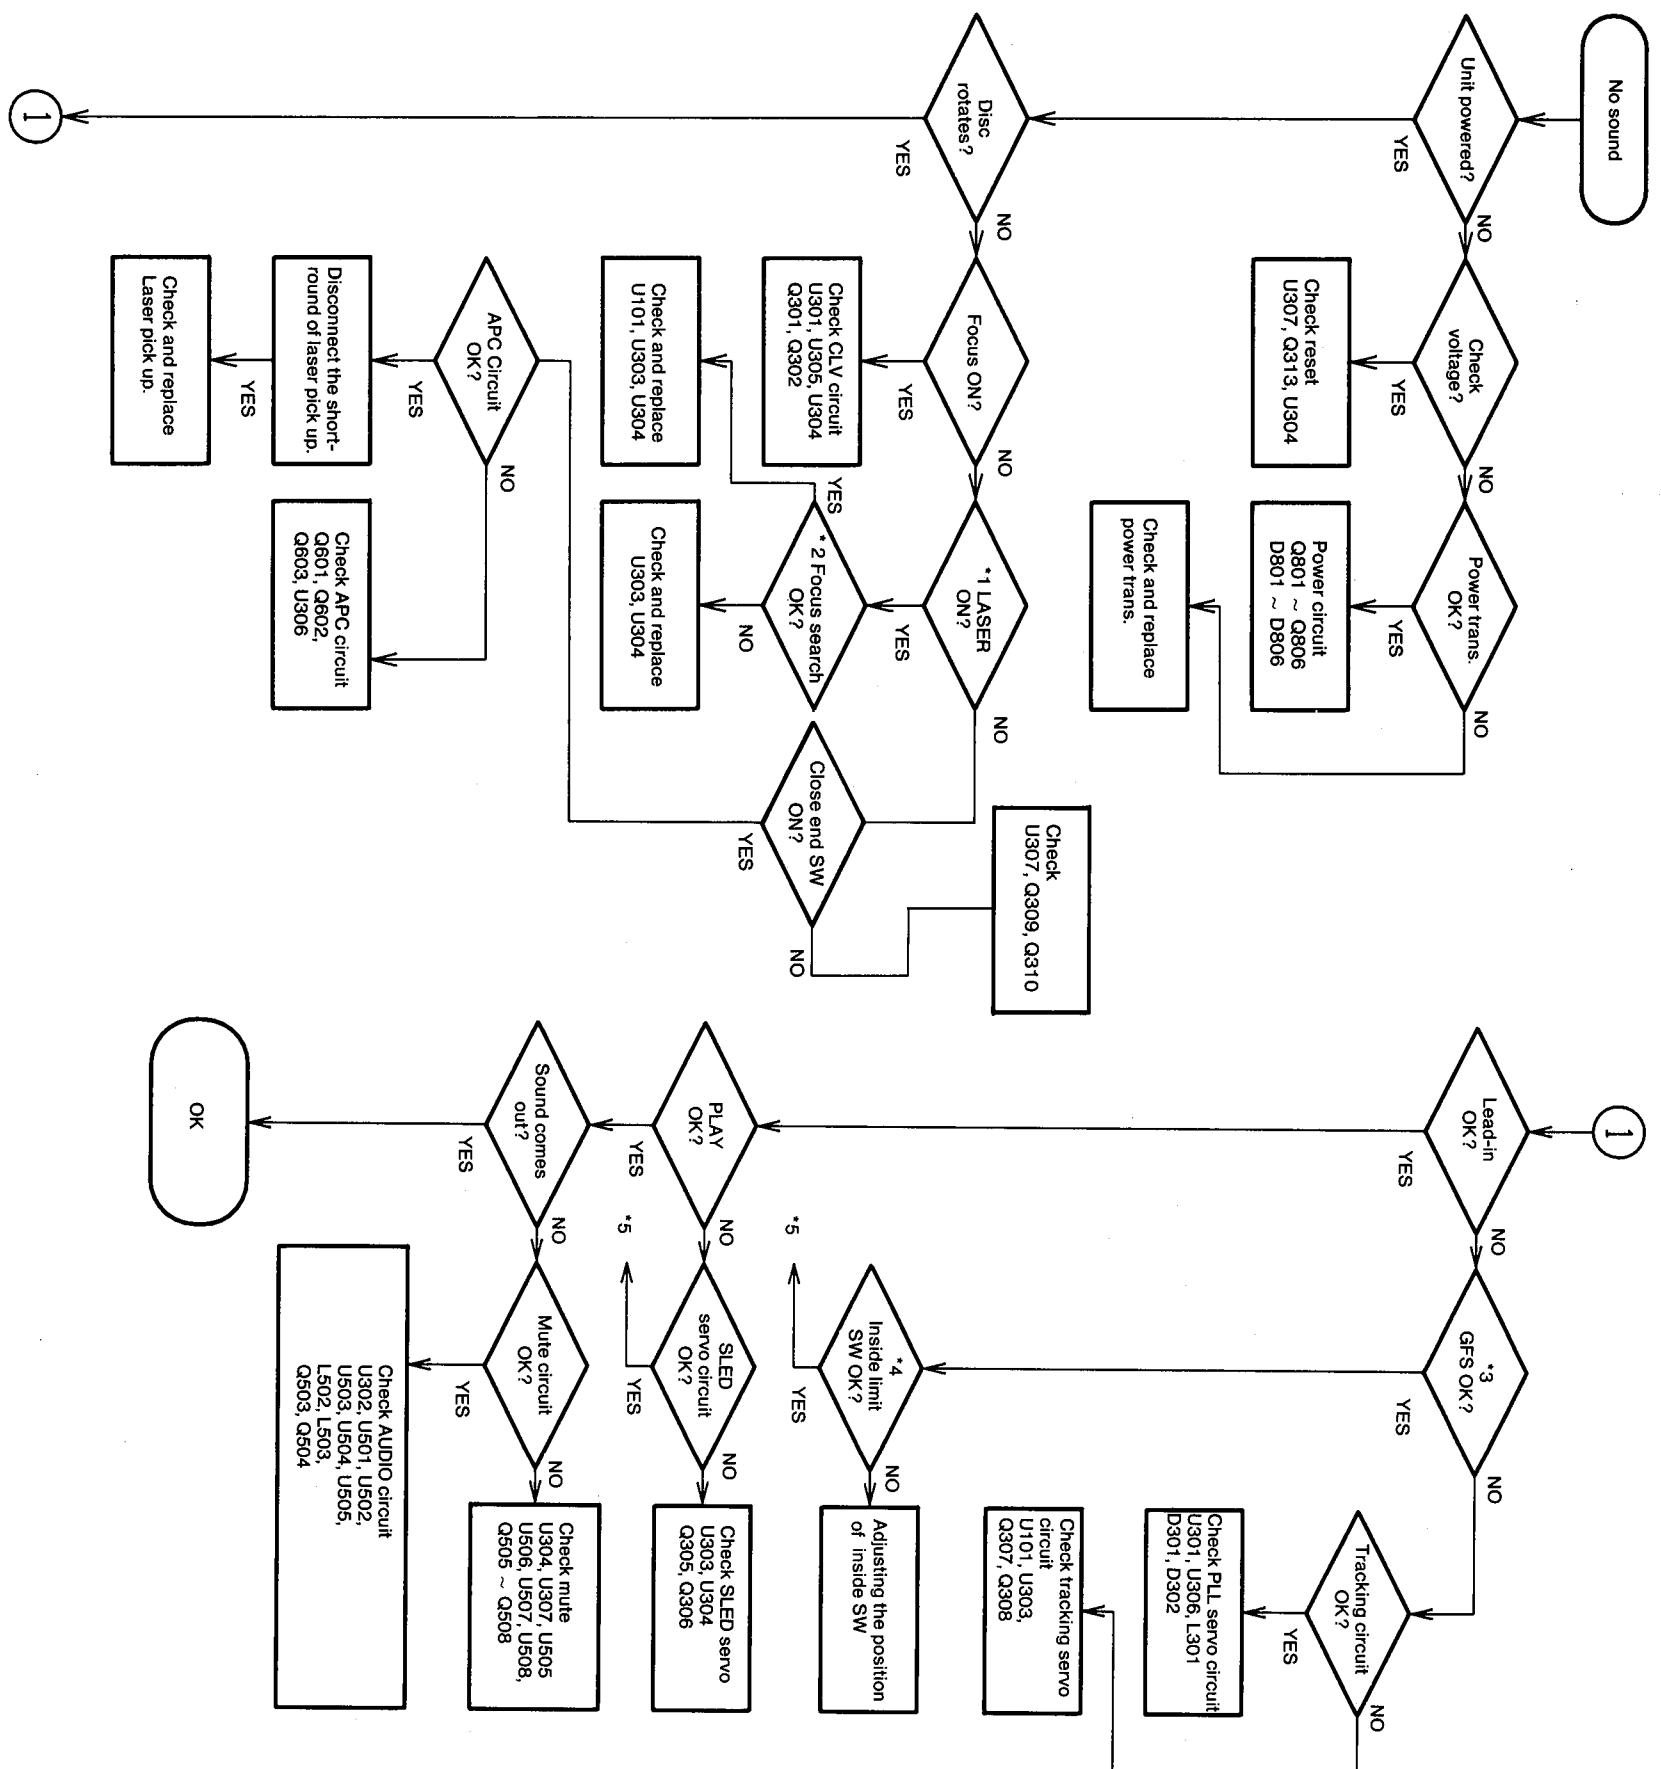

Eccentric disc

Normal disc

QUICK TROUBLE SHOOTING

*1 Laser diode light check

- *1 Laser diode light check

a. Checking light with your eyes.
The object lens of the laser pickup goes up and down

for four seconds when the disc tray closes with no disc. While the lens goes up and down, check that laser goes from the laser pickup.

Keep your eyes from the laser pickup in 12 inches distance when checking the laser light from the laser pickup.

..2 Focus search

lens goes up and down.
If the player does not perform above motion, check the close end switch and inside limit switch.

..3 GFS signal Judgement of frame sync. (U304, 35pin). When it is locked GFS signal is "high".

*4 Position of the inside limit switch
Check the position of the switch is in the disc lead-in

5:20 (Sony test disc type 4 only) by adjusting the ground. The display shows the track time when the laser pickup is at the switch. Keep this time between -4:00 ---

*5 To find inferiority of a disc.

If a disc is inferior even if the player is normal, playback is impossible. When you judge that the disc is inferior make following tests.

a. Scratches, dirt and pin holes
Take a careful looking at the disc. If there is dirt or
finger prints wipe it off. If you do not see scratches
or pin holes on the disc, check the RF signal.

o. Eccentricity
Check the waveform of the tracking servo signal.

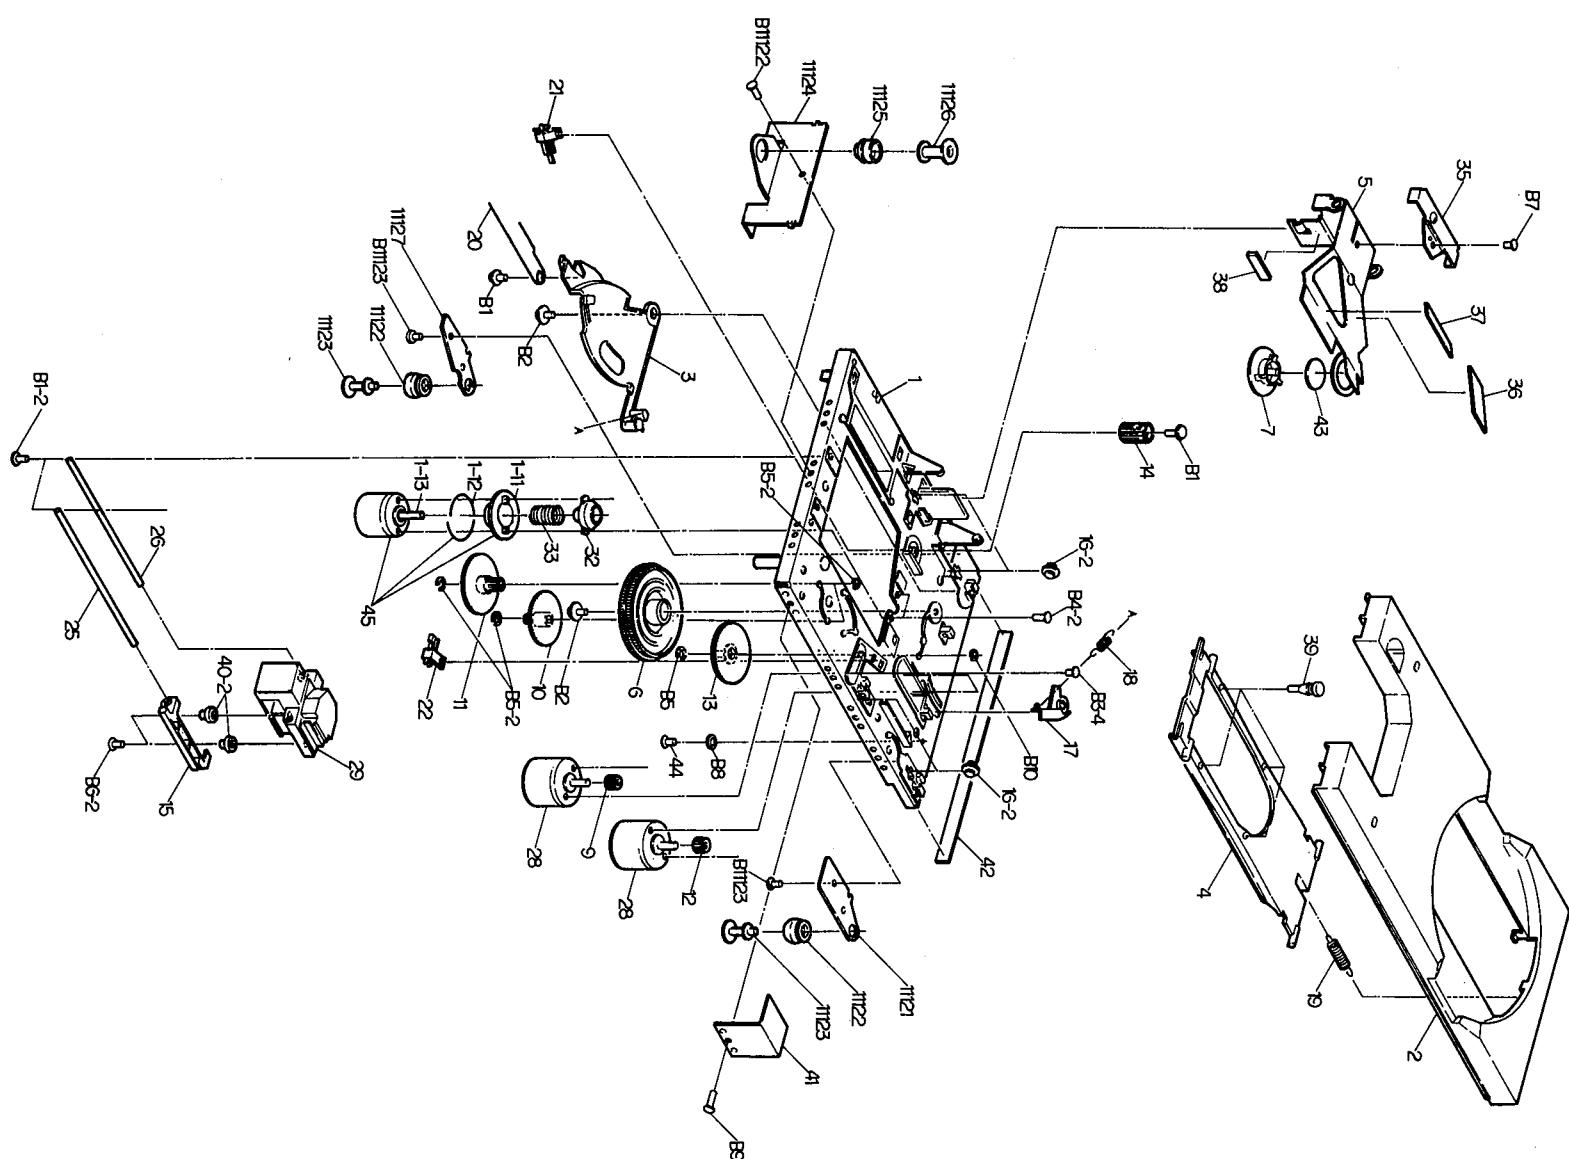

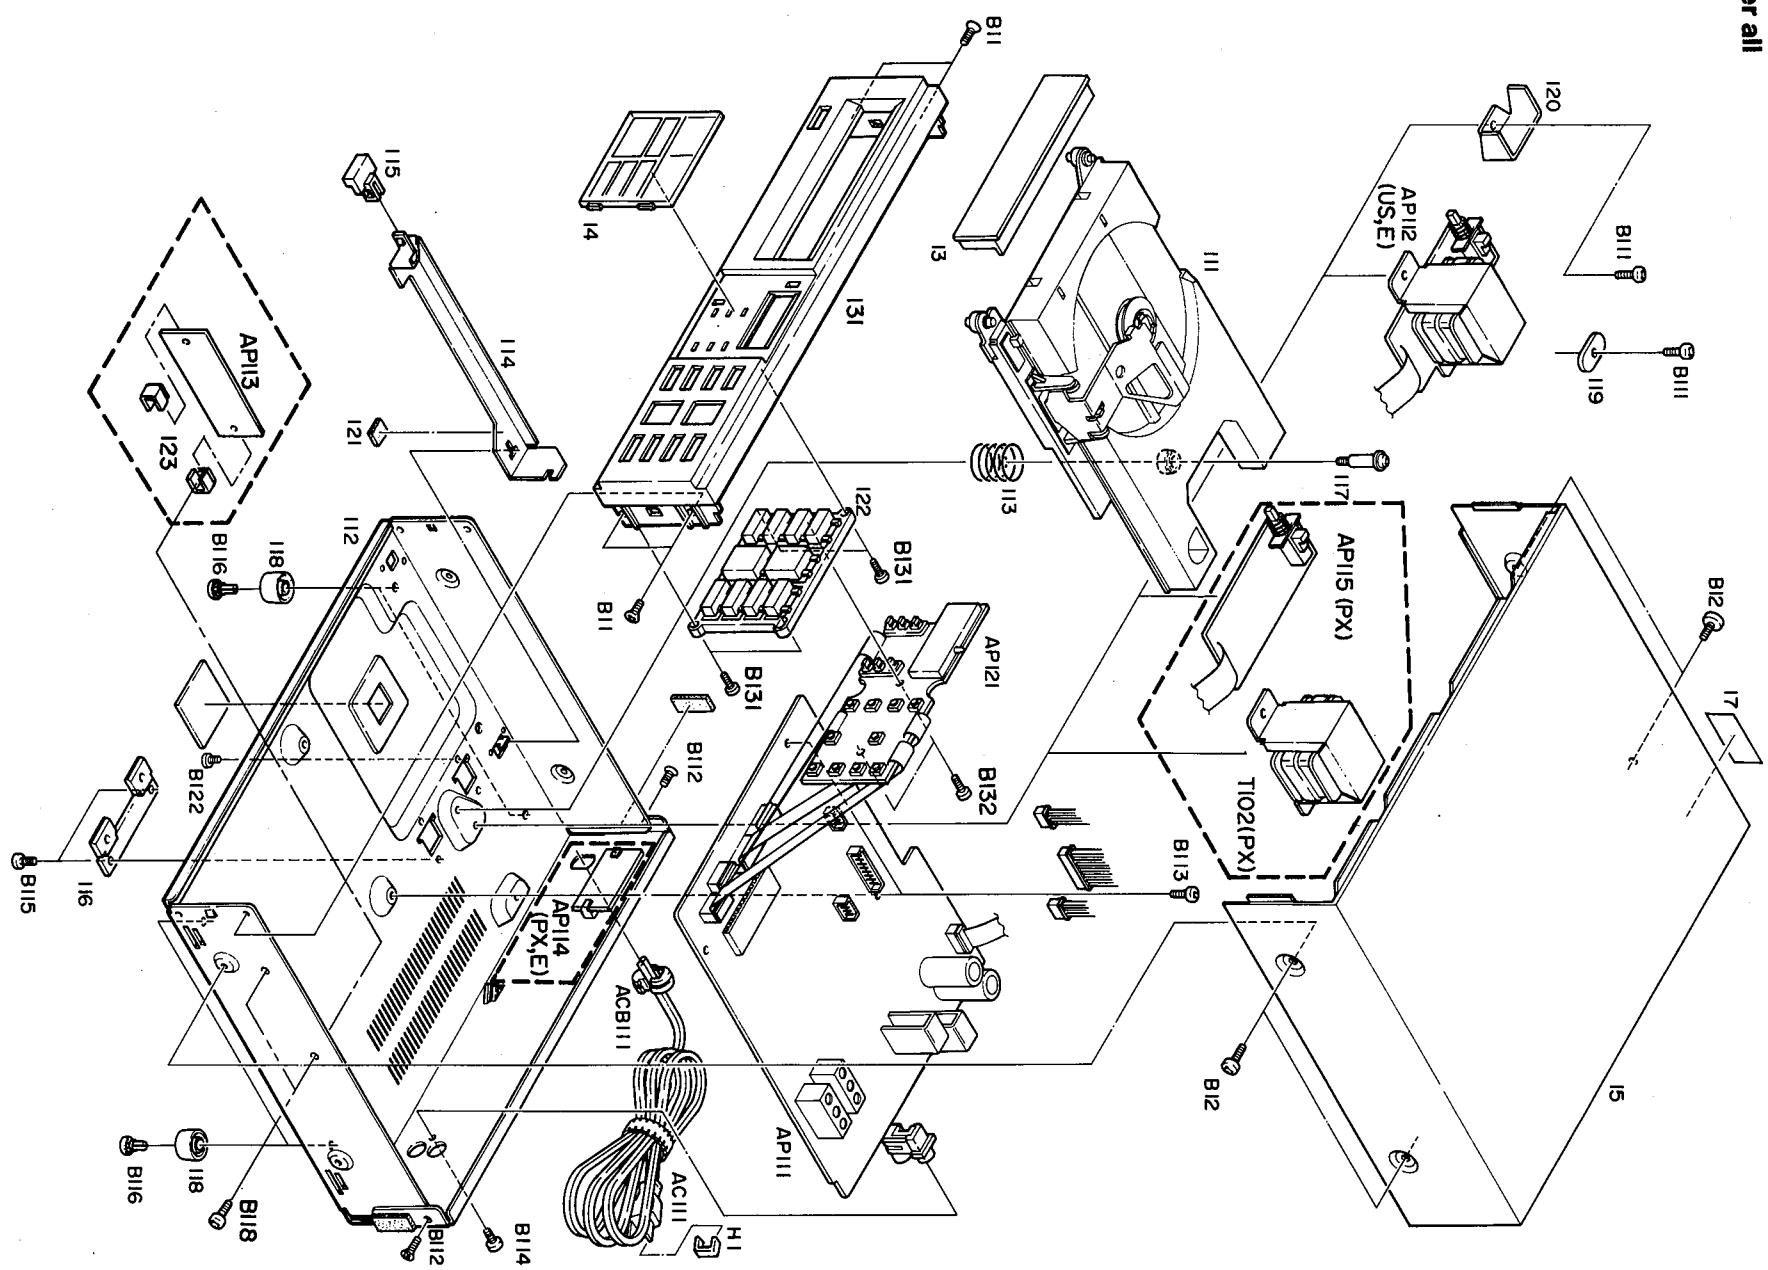

C. Out of focus
When the disc is bent, focus is out. Check the focus

In this case chucking operation may be incorrect. When the disc is normal, a horizontal and vertical motion of the disc is within 0.3mm. If it is over 0.3mm, check the disc table, sliding chuck and chuck arm.
