

## SERVICE MANUAL

ADVENT MODEL 100

NOISE REDUCTION UNIT

Advent Corporation  
377 Putnam Avenue  
Cambridge, Mass. 02139

NRU 10-70

## 1.1 PERFORMANCE AND ELECTRICAL SPECIFICATIONS

### FREQUENCY RESPONSE:

Dolby Out: 20-20,000Hz +0 -1db  
Dolby In: 20-20,000Hz +1 -2db  
With MX FILTER "in" the upper limit is 15 kHz

### DISTORTION:

Less than 0.5% THD @ Dolby Level, 20-20,000Hz

### SIGNAL TO NOISE RATIO:

(Measured straight through exclusive of tape deck)  
-66db from Dolby Level

### NOISE REDUCTION vs. FREQUENCY:

3db @ 600Hz  
6db @ 1200Hz  
9db @ 2400Hz  
10db @ 4000Hz to 20,000Hz

### INPUT SENSITIVITIES:

MIC: 0.5mv for Dolby Level @ 1000 ohms (50,000 ohms  
after serial number 02800)

LINE: 60mv for Dolby Level @ 50,000 ohms

FROM TAPE RECORDER OUTPUT: 150mv for Dolby Level @  
50,000 ohms. (Adjustable  
by PLAY CAL control)

### OUTPUT LEVELS:

TO TAPE RECORDER INPUT: Maximum 500mv for 0 VU  
tape level @ 1000 ohms.

TO AMP INPUT: 1.0 V from 0 VU tape level, less than  
1000 ohms output impedance.

### MX FILTER:

less than 1db down @ 15kHz  
greater than 30db down @ 19kHz  
greater than 20 db down @ 38kHz

In open reel recording, Dolby Level is the same flux level  
on the tape as Ampex Operating Level.

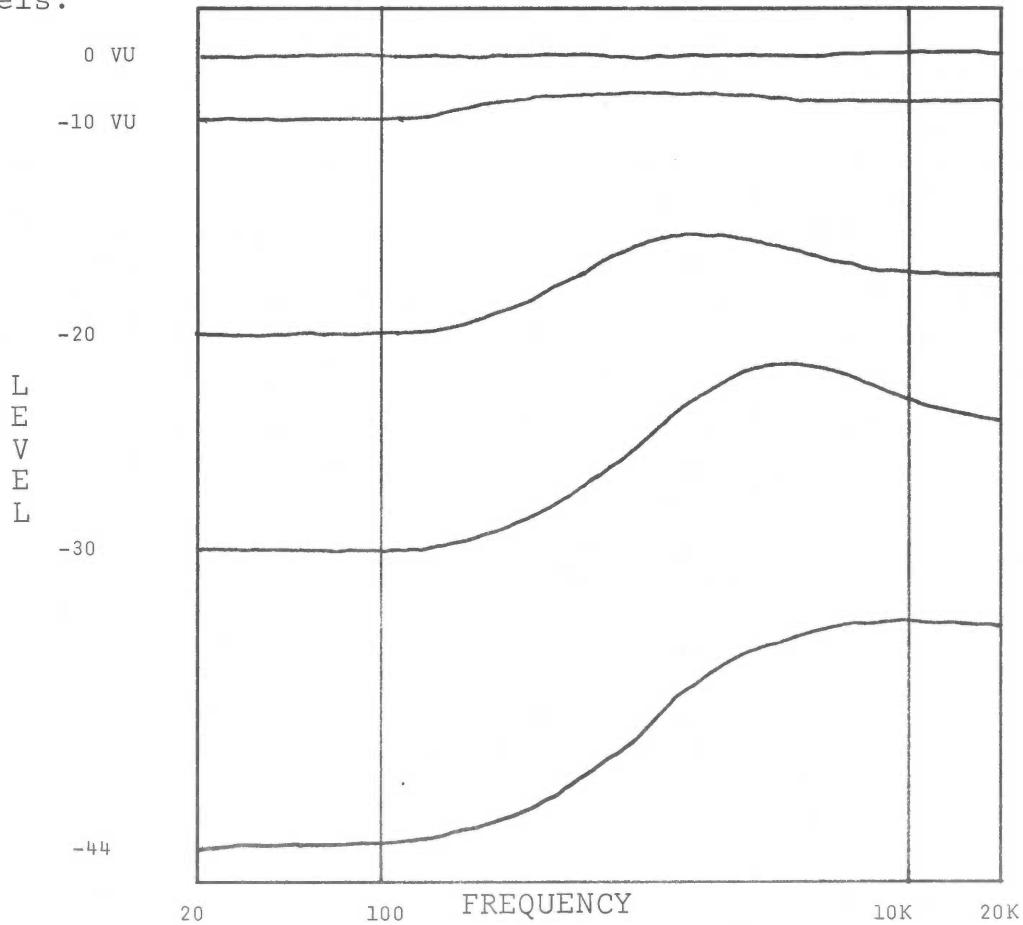

For cassettes, Dolby Level is defined as a flux level on  
the tape of 200 nanoWebers per meter.

## 1.2 INTRODUCTION TO THE MODEL 100

THE ADVENT NOISE REDUCTION UNIT - MODEL 100 is a simultaneous record-playback control center incorporating the "B-type" Dolby Audio Noise Reduction System\*. This system is designed to reduce the noise inherent in the tape recording process - "tape hiss" - and does so by improving the signal to noise ratio by 3db at 600Hz increasing rapidly to 6db at 1200Hz and 10db at 4000Hz and above.

The principle of the system is to boost low-level signals before they are recorded and to attenuate the playback signal in precisely a complementary manner. The noise added during the recording process is therefore reduced in a like manner.

The Dolby action increases as the record input signal level decreases. Higher level signals are passed thru the circuitry unchanged. The graph below shows representative curves of the Dolby circuitry boost action at different input levels.

Again, in playback only the previously boosted low-level signals are attenuated by the same amount they had been boosted, the higher level signals are passed thru unchanged. It is thru this playback attenuation process that the noise reduction takes place. The noise added during the recording process is attenuated with the previously boosted high frequency signals. Since the Dolby circuit does not discriminate between signal and noise it automatically attenuates the noise as it attenuates the signal.

\* A Trademark of Dolby Laboratories, Inc.

### 1.3 CIRCUIT DESCRIPTION

Inputs are made thru the MIC and FROM PREAMP OUTPUT (line input) jacks on the rear panel.

The MIC input feeds directly into a microphone pre-amp, then to the MIC input level control. The AUX input feeds directly into the LINE input level control then to the 22K isolating resistor.

The outputs of the MIC and LINE controls feed into the master RECORD LEVEL control, which adjusts both channels simultaneously.

The signal is then fed to a X4 voltage amplifier, then to the record Dolby circuit thru a low-pass filter. Note: Part of the low-pass filter is always in the circuit to eliminate supersonic high frequency components from the input signal (RF interference, etc.) that might erroneously trigger the Dolby circuitry. The other section of the filter is a notch filter to eliminate the 19kHz pilot signal in FM multiplex broadcasts, and may be switched in or out of the circuit by operation of the MX FILTER switch.

The Dolby Level calibration circuit may also be connected to the input of the record Dolby board by activating the spring-loaded REC CAL TONE switch located on the front panel. This switch provides operating D.C. voltage to a 400Hz oscillator, the output of which (adjustable by rear panel 100 MV OSC CAL pot) feeds to the inputs of both record Dolby boards. The switch action also disconnects the meter amplifiers.

The output of the record Dolby board is fed into a X5 voltage amplifier and then through the back panel REC CAL control to the TO TAPE RECORDER INPUT jack.

Playback signals from the tape recorder are fed to the jacks labeled FROM TAPE RECORDER OUTPUT to the Play Cal control, then to a bias filter. Concurrently the signal is fed to the meter circuit.

The output of the bias filter is fed to the playback Dolby board then to the TAPE position of the SOURCE-TAPE switch. The source position of that switch connects to the input of the record Dolby Board.

The output of the SOURCE-TAPE switch is fed to the OUTPUT LEVEL control then to a X10 voltage amplifier then to the TO AMP INPUT jack and Headphone jack.

## 2.1 DISASSEMBLY INSTRUCTIONS

First, remove the bottom panel. The screws securing the four feet do not hold the panel to the chassis and need not be removed. Beneath the panel is a bottom shield. Remove it by carefully bending the middle area of it away from the chassis and pull one of the long edges from under the chassis lip until it is clear.

Next, the pilot lamp located on the corner of the chassis adjacent to the on-off switch must be moved to prevent its possible breakage. Unclip it from the chassis and lay it off to one side -- away from the bottom of the chassis.

Next, remove the top panel.

The front and back panels may now be swung out and away from the main chassis, pivoting on the two screws that connect each of their bottom edges to the chassis.

Finally, any of the printed circuit boards may be removed for inspection or repair by pulling it smoothly up from the chassis. Move it only in the vertical plane; bending it may damage the amp pin connectors.

IMPORTANT: When reassembling the unit, tighten the four screws and nuts at the corners of the front and back panels.

## 2.2 REPAIRING THE MODEL 100

Follow the check out procedure on the next page to quickly establish that the Model 100 is operating properly. Please go through the entire procedure in the order set down, since the later procedures presume that the earlier ones have been performed.

If either channel of the Dolby System fails the frequency response test at -25 db, you can then isolate the fault by exchanging the Record and/or Play Dolby board from the known good channel for those in the defective channel. This will determine whether the Play or Record Dolby is at fault. The faulty board should then be aligned (see Sections 2.3 and 2.4).

SECTION	PROCEDURES	COMMENT
Oscillator Calibration	Connect VTVM to 100MV TEST jack. Switch REC CAL TONE on.	Adjust OSC CAL 100MV pot for 100mv±0.5db.
Dolby Meter Calibration	Switch REC CAL TONE and METER TEST on. (Use a #6 screw head to hold the switch on.)	Adjust METER CAL pots so that meters read to the Dolby Level line.
Dolby Calibration	Connect signal generator (1 kHz @>100mv) to FROM PREAMP OUTPUT jacks. Interconnect TO and FROM TAPE RECORDER jacks. Connect VTVM and scope to TO AMP INPUT jacks. Set RECORD LEVEL and REC CAL pots full up (clockwise from rear view). MX FILTER and DOLBY switches "out". SOURCE-TAPE switches to TAPE.  Switch METER TEST on.	Adjust LINE INPUTS so that meters read to Dolby Level line.
	Release METER TEST switch.	Adjust PLAY CAL so that meters read to Dolby Level line.
Frequency Response	Set OUTPUT LEVELS for convenient reference on VTVM. Sweep signal generator 20-20kHz.	Output +0,-1db.
Record-play Dolby	Decrease level from signal generator by 25db. Switch Dolby in. Sweep signal generator from 20Hz to 20kHz.	Output flat to +1,-2db.
Noise and Hum	Increase signal generator output by 25db (to Dolby Level). Increase OUTPUT LEVELS full up to read 1 volt out. Disconnect signal generator.	Noise 66db down from Dolby Level.

## 2.3 TEST AND ALIGNMENT OF RECORD DOLBY

Set Up: Feed oscillator @ 5kHz to pin 1 of Record Dolby. Connect VTVM to pin 4. At Step 2, reconnect VTVM to pin 6.

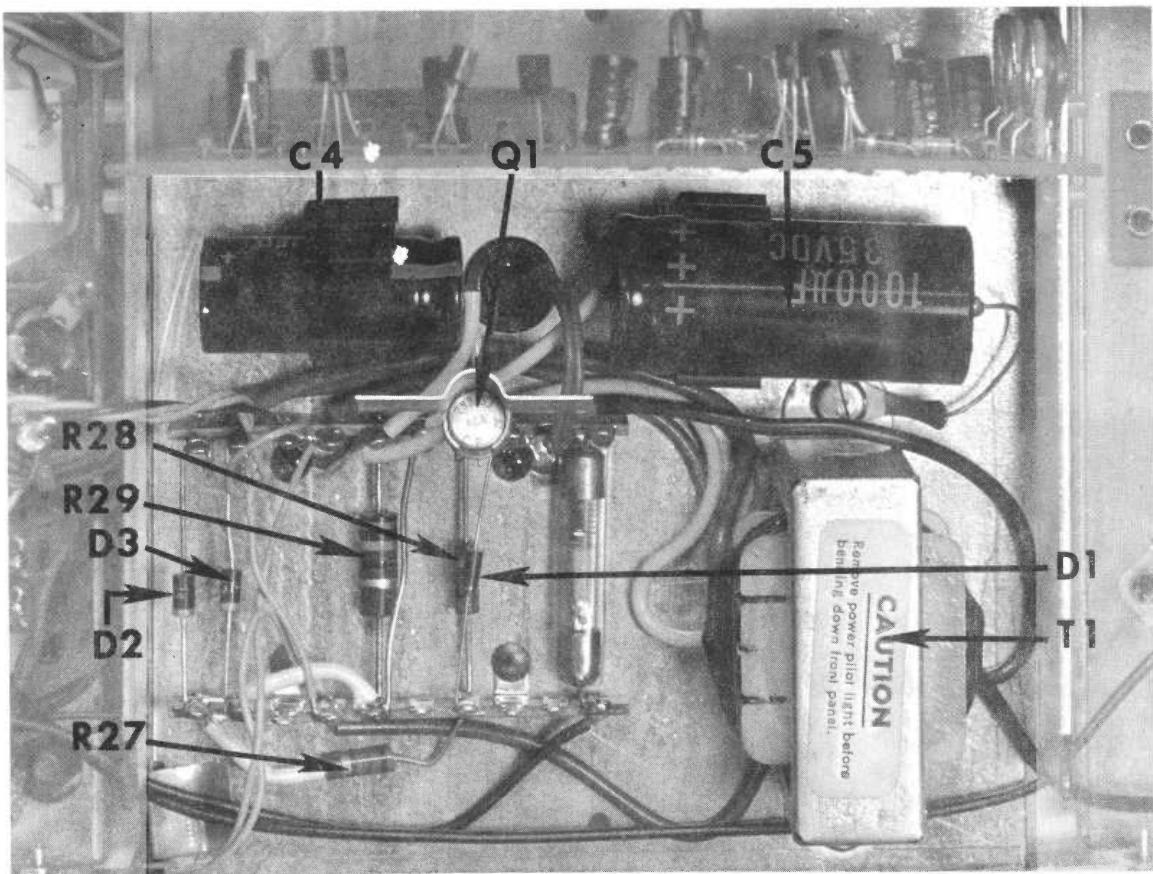

STEP	5kHz INPUT	VTVM	SCOPE @ OUTPUT (PIN 6)	FET	DOLBY	COMMENT
1	To input (pin 1)	10 mv fs	5 mv/div	ground	out	Short FET (pin 7) to ground Adjust signal gen for 3 mv @ meter point (pin 4)
2	"	10 mv fs @ output (pin 6)	"	"	in	Switch DOLBY in - adjust GAIN pot for 10 db increase
3	"	100 mv fs	50 mv/div	remove ground	"	Adjust LAW pot for 2 db decrease
4	"	"	"	ground	"	Short FET to ground-check for 2 db increase
5	"	"	"	"	out	Check for 10 db decrease
6						If the reading for either Step 4 or 5 is incorrect repeat Step 2 and 3 until the proper results are achieved
7	100 mv @ input	1 v fs	0.5 v/div	remove ground	out	Check output for a reading of approximately 2v p-p with no visible distortion
8	3 mv @ input	10 mv fs	5 mv/div	ground	"	Seal GAIN and LAW pots with Glyptal cement - recheck Steps 4 and 5

## 2.4 TEST AND ALIGNMENT OF PLAYBACK DOLBY

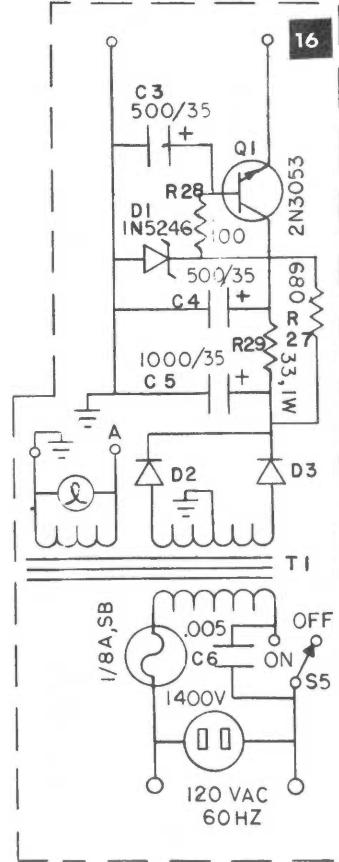

Set Up: Feed signal generator (5kHz) to pin 2 of Playback Dolby. Connect VTVM and scope to pin 6.

STEP	5kHz INPUT	VTVM (pin 6)	SCOPE (pin 6)	FET	DOLBY	COMMENT
1	Approx 7.6 mv @ input (pin 2)	10 mv fs	5 mv/div	ground	out	Short FET (pin 7) to ground (pin 5) Adjust sig gen for 7.6 mv @ output (pin 6)
2	"	"	"	"	in	Switch DOLBY in - adjust GAIN pot for a 10 db drop (to 2.4 mv)
3	"	"	"	remove ground	"	Remove FET ground - adjust LAW pot for a 2 db increase (to 3 mv)
4	"	"	"	ground	"	Short FET to ground - check for 2 db decrease
5	"	"	"	"	out	Check for 10 db increase
6						If the reading for either step 4 or 5 is incorrect repeat step 2 and 3 until the proper results are achieved
7	100 mv @ input (pin 2)	100 mv fs	20 mv div	"	out	Check input and output level for unity gain within 1 db and no visible distortion
8	7.6 mv @ input (pin 2)	10 mv fs	5 mv/div	"	in	Seal GAIN and LAW pots with Glyptal cement - recheck Steps 2 and 3

2	60-653-010	Resistor 10K Ohms $\frac{1}{4}$ wt. 10%	R 13, R 14
4	60-653-041	Resistor 560 Ohms $\frac{1}{4}$ wt. 10%	R 17, R 18, R 19, R 20
1	60-652-013	Resistor 33 Ohm 1 wt. 10%	R 29
2	60-613-017	Elec. Cap 500 MFD 15V TW Axial	C 1, C 2
2	60-613-008	Elec. Cap 500 MFD 35V	C 3, C 4
1	60-613-018	Elec. Cap 1000 MFD 35V	C 5
1	60-674-002	Transistor 2N-3053	Q 1
2	60-663-001	Diodes 40267	D 2, D 3
1	60-743-003	Fuse 1/8 Amp Pig Tail	
1	60-663-006	IN5246A Diode	D 1
1	60-651-063	Resistor 680 Ohms $\frac{1}{2}$ wt. 10%	R 27
1	60-651-064	Resistor 100 Ohms $\frac{1}{2}$ wt. 10%	R 28
1	60-632-001	.005 MFD Cer. Disc 1400V	C 6

BACK PANEL ASSEMBLY

QTY.	PART #	DESCRIPTION	SYMBOL
1	40-693-005	Black AC Line Cord 6'	
1	60-312-013	Heyco SP 4 Strain Relief	
1	50-211-008	AC Receptacle #MSS-0818-1	
4	50-211-004	Dual Phono Sockets #352	
4	50-211-005	Dual Phono Insulators #352A	
1	50-263-008	3 POT Mom. Slide Switch #50209M	S 3
2	50-714-006	Controls 50K Screwdriver Adjust. CTS # VA 2403	R 23, R 24
2	50-211-006	Mic Jack Switchcraft # L 112 A	J 1, J 2
2	60-653-023	Resistor 1K $\frac{1}{4}$ wt. 10%	R 1, R 2
