1. Starting MD Test Mode

While holding down the “MD” function key, plug the power cord into AC outlet.

Cautions: 1) While the test mode is started, the abnormality in mechanism is ignored and operation is performed: If any abnormality is detected in operation, immediately unplug the power cord.

2) During test mode, normal playback or recording is not possible.

2. Checking MD Test Mode and Audio Output

1) After the test mode has started, the display will be as follows, and the test mode can be used.

2) Checking audio output

A 1kHz, -17dB (140mV) signal is output from the MD mechanism output (D/A OUT). The speaker output level is determined by the sound volume before the test mode has started.

3. Releasing MD Test Mode

1) Press the MD EJECT key to remove the disc.

2) Unplug the power cord from the AC outlet.

* If the test mode is released using the procedure other than above, the operation may not be normal when power is turned on again. In this case, unplug the power cord.

4. Switching to Servo Standby Mode

Pressing the STOP key after starting test mode will switch to the servo standby mode (ALL SV OFF will light in the display): This mode will be switched to each mode. Pressing the STOP key in each mode will return the display to ALL SV OFF.

5. Checking Sled Feed Operation

Press the B-SKIP or F-SKIP key in the “ALL SV OFF” status: The lens and pickup will move to the inner or outer circumference. If the INSIDE LIMIT SW is pressed when the pickup moves to the innermost circumference, “JAZZ” will light.

- XPLCK is the inverse of the EFM PLL clock. The PLL is designed so that the falling edge and the EFM signal transition point coincide.
- GFS goes high when the frame sync and the insertion protection timing match.
- RFCK is derived from the crystal accuracy, and has a cycle of 136µ.
- C2PO represents the data error status.
- XRAOF is generated when the 32K RAM exceeds the ±28F jitter margin.

7	OSC OUT	O	
8	CHARA	O	The character signal is output from this terminal. (MOD 0: when H, the external sync signal identification signal is output from this terminal. This output signal tells whether the external sync signal is present or not. When external sync signal is present, H is output.) When reset ($\overline{RST}$ terminal = L), the dot clock signal (LC oscillator) is output. (It is not output when reset by the reset command).
9	$\overline{CS}$	I	Enable signal for the serial data input is input to this terminal. The serial data input is enabled at L. Pull-up resistor is built-in. (Hysteresis input).
