1. Introduction

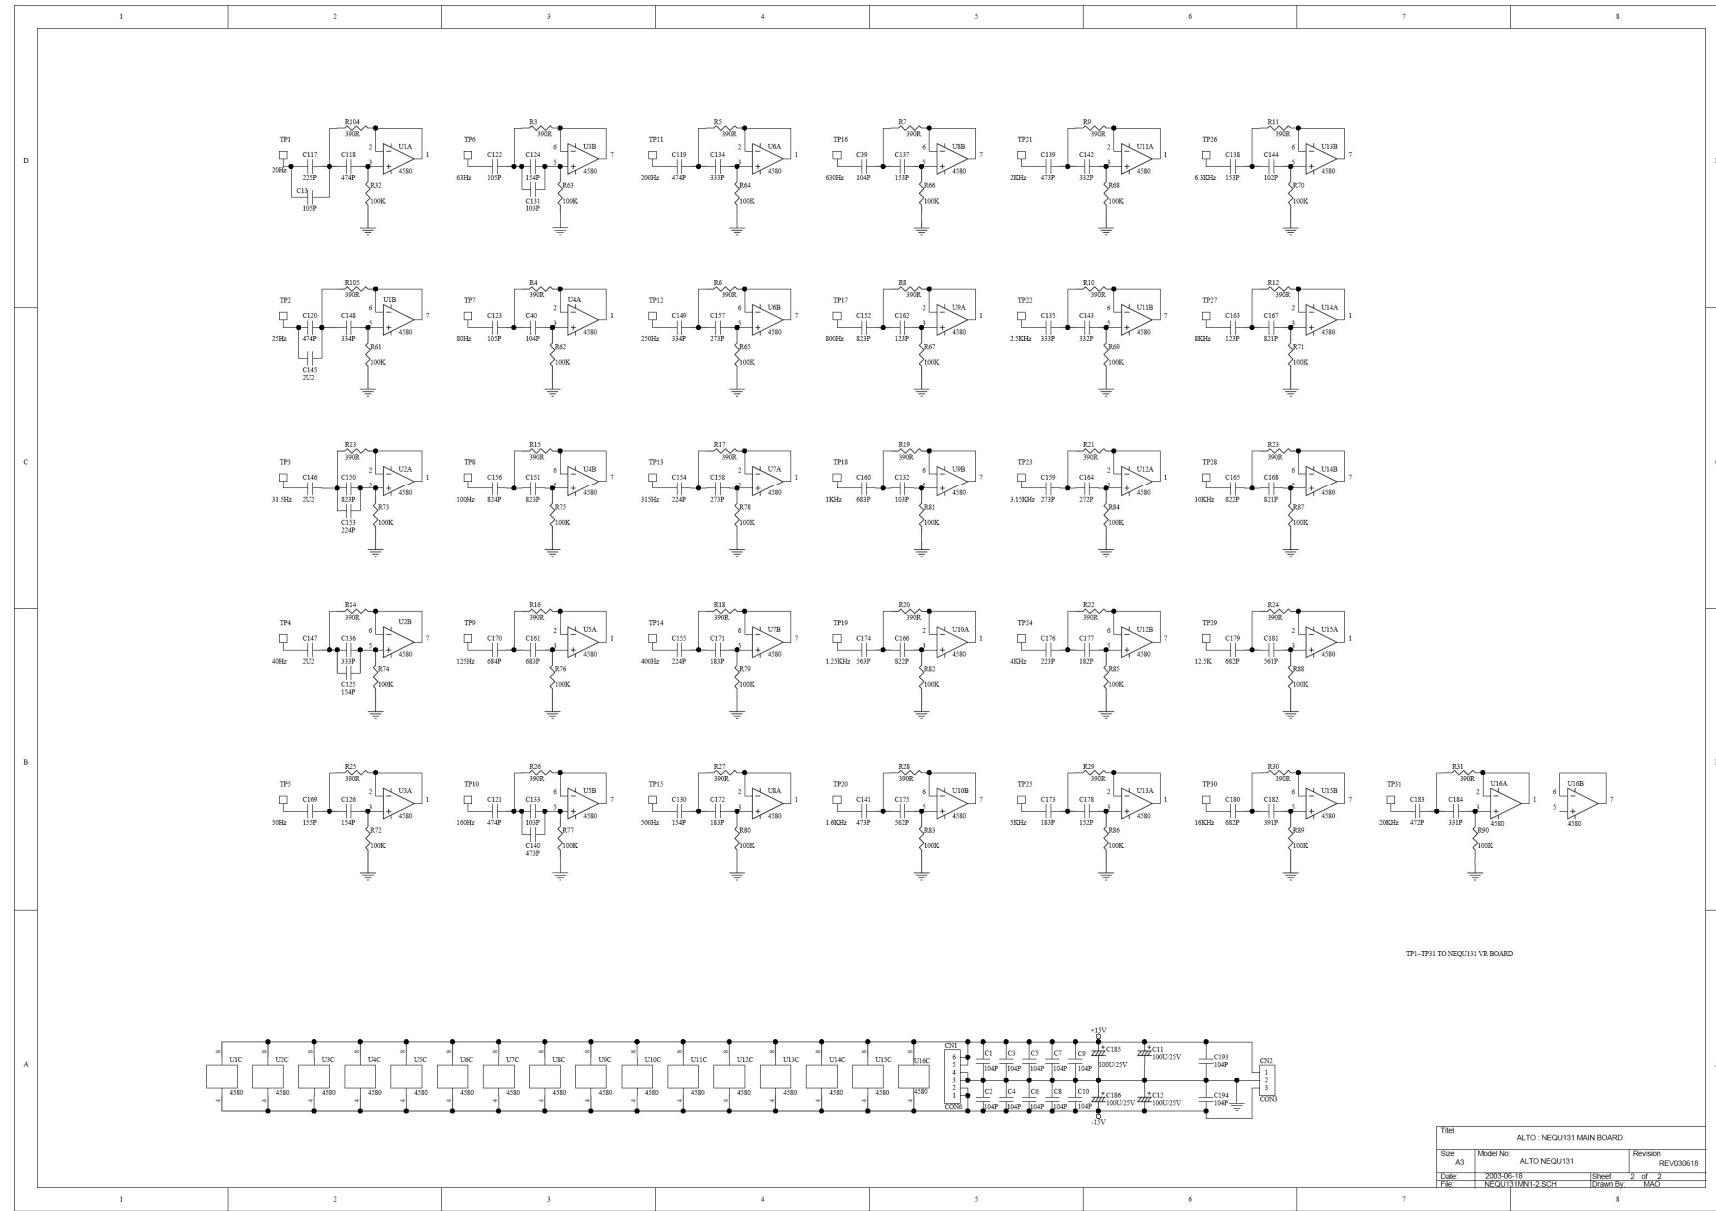

- 31 band, dual channels pure pre-amplifiers.
- Selectable hi-pass filter with 40Hz cut-off frequency.
- Selectable Low-pass filter with 16KHz cut-off frequency.
- Automatic switch to bypass function.
- Controllable input level for different input level and signal.
- Low-noise and precise linear potentiometer for frequency adjustment.
- Selectable +/-6 and +/-12dbu of EQ.
- Selectable EQ bypass function.
- Signal and distortion LED for input and output level.
- VU meter for output level.

PCB: EQU231VUSW-II Bottom Layer

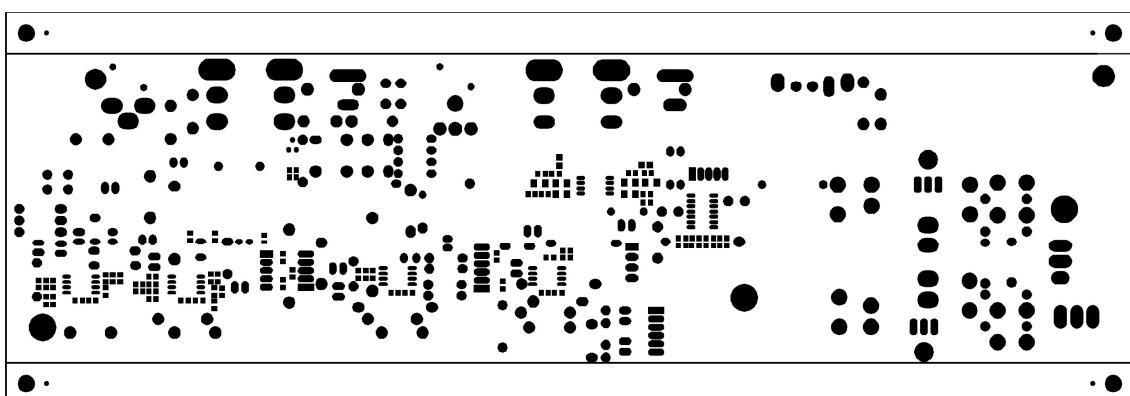

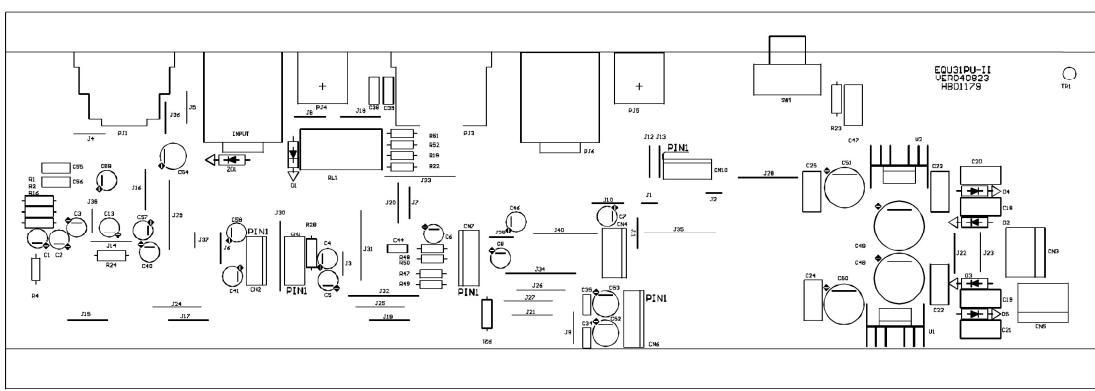

PCB: EQU31PU-II Bottom Layer

PCB: EQU31PU-II Bottom Overlay

PCB: EQU31PU-II Top Layer

PCB: EQU31PU-II Top Overlay

6. Test Procedure

1) Test Equipment:

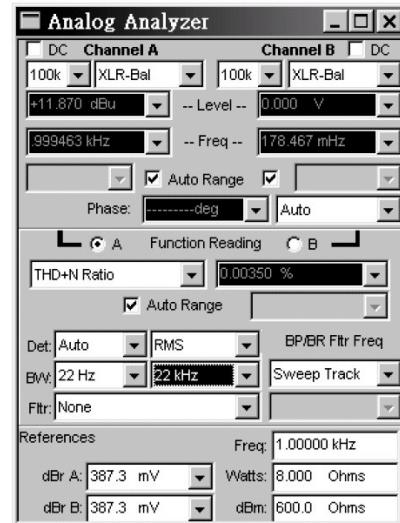

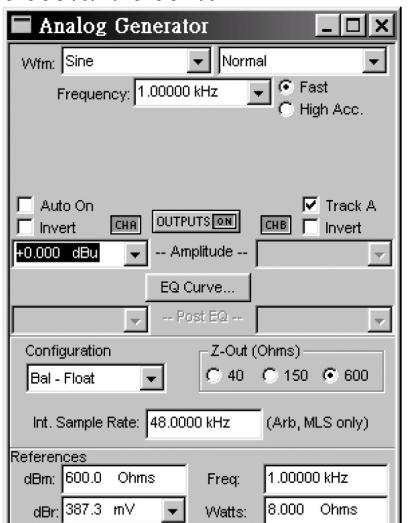

1. AP (Audio precision)
2. Dual-track oscilloscope

2) Equipment setting

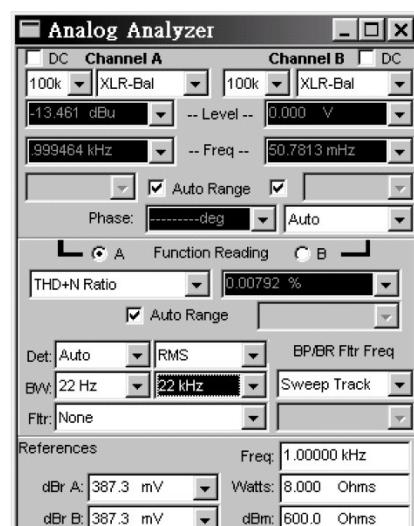

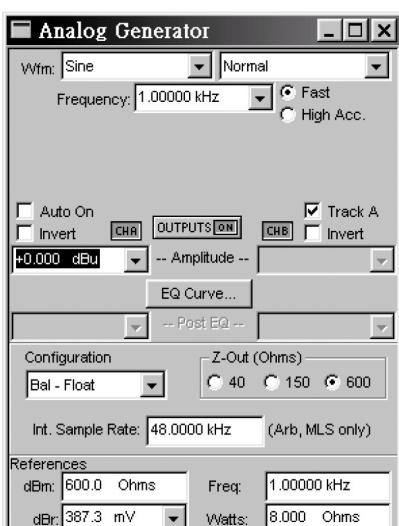

1. Set proper AC input voltage.
2. Connect the output signal of AP to the input of EQU131VU-MKII.
3. Connect the output of EQU131-MKII to the input of AP.
4. Set Lift GND to GND.

3) Adjust according to following procedures.

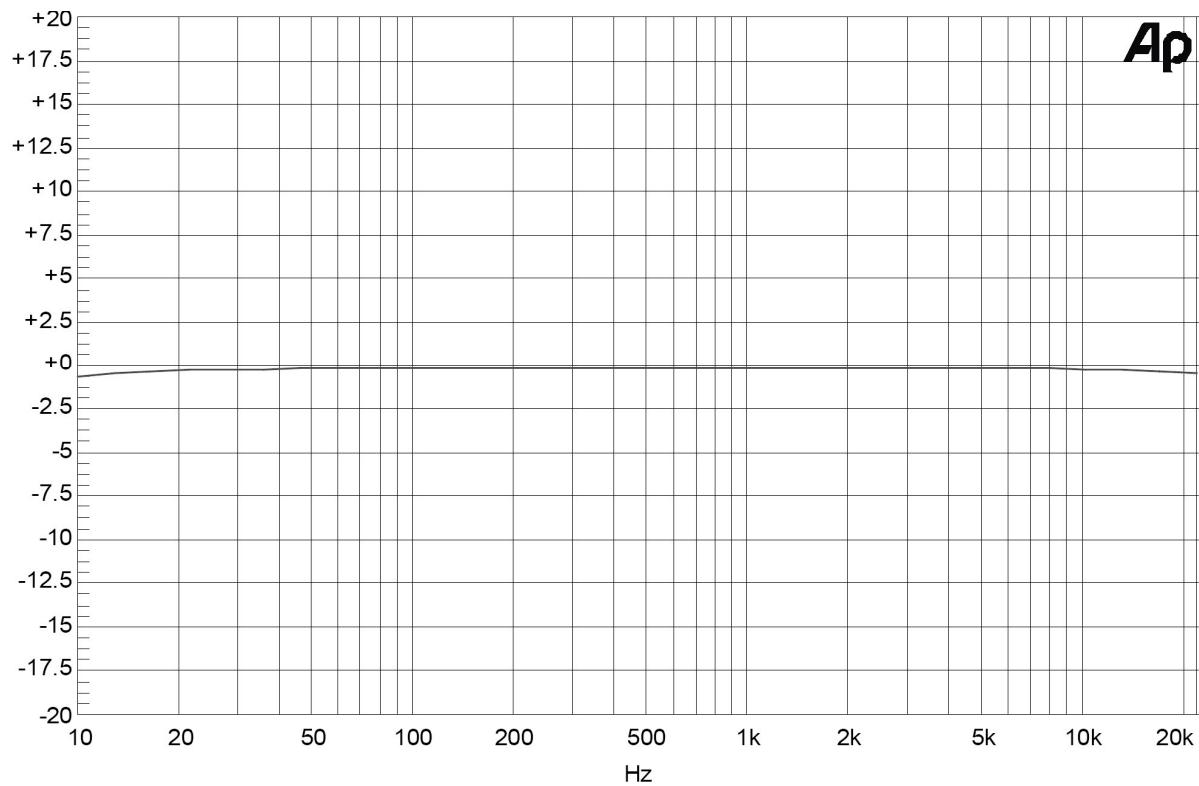

1. Set the potentiometer of 31BAND EQ in center, set the input level at 0dB, all buttons out.
2. Turn input level to maximum, the output level shall be +12dB/+/-1dB, and the distortion shall be 0.003%/+/-0.001%.

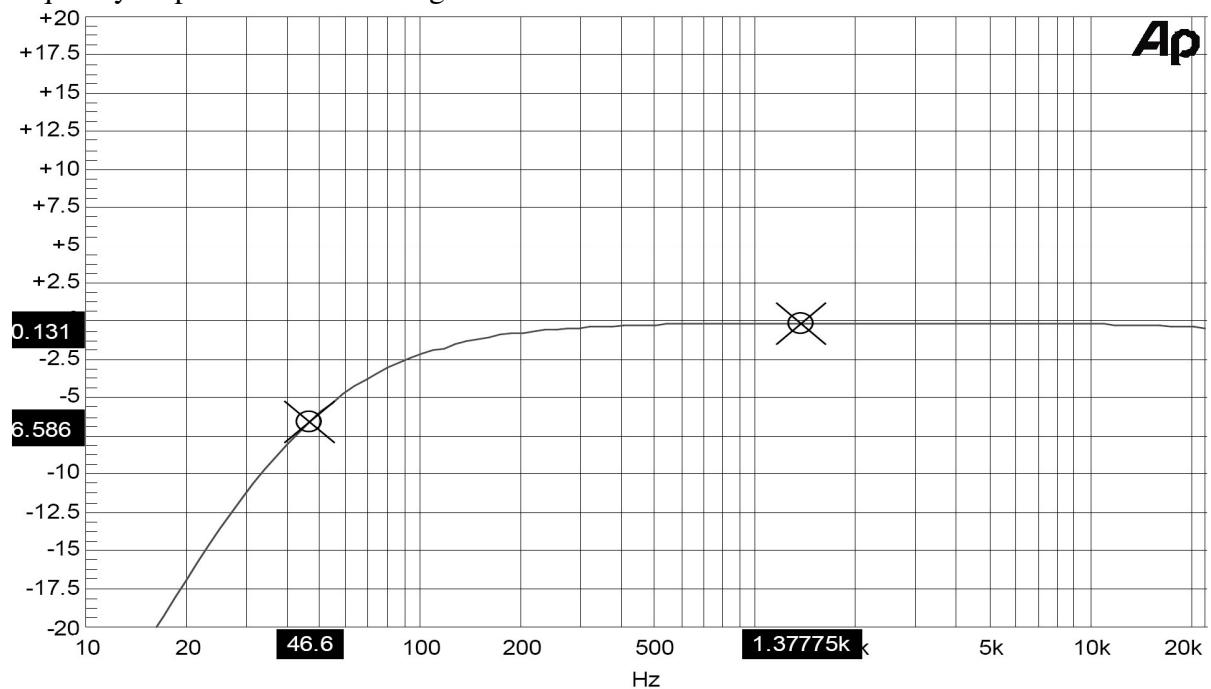

3. Set INPUT LEVEL at minimum, the output level shall be -12db/+/-1dB, and distortion shall be 0.007%/+/-0.002% .

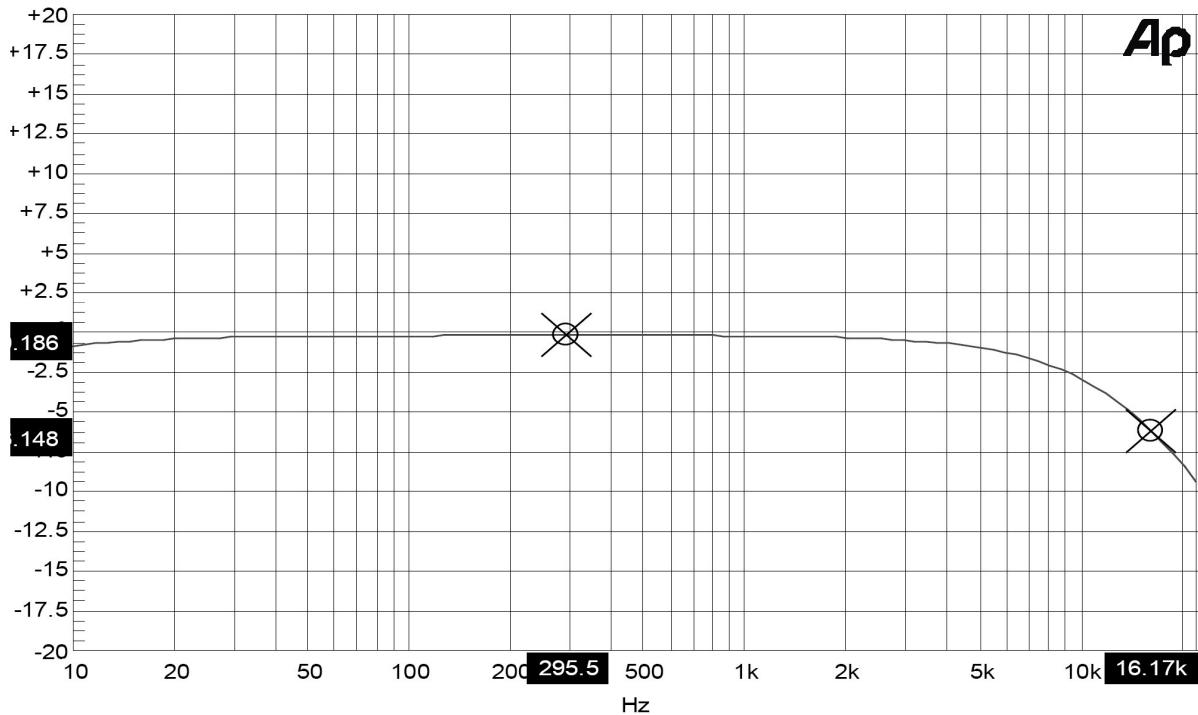

4. Adjust the input level so that the AP output is 0dB, the frequency response is as following.

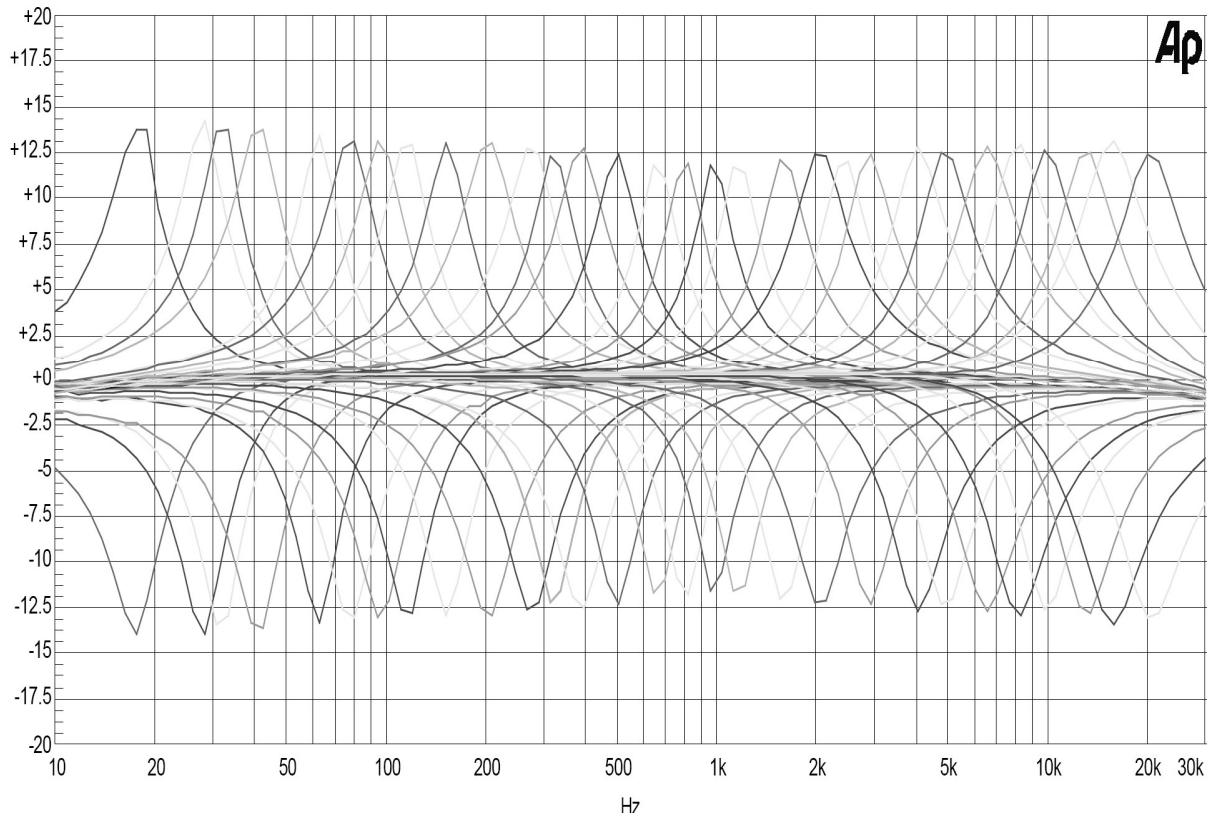

5. Adjust the input level so that the AP output is 0dB, press the Hi-pass button and the frequency response is as following.

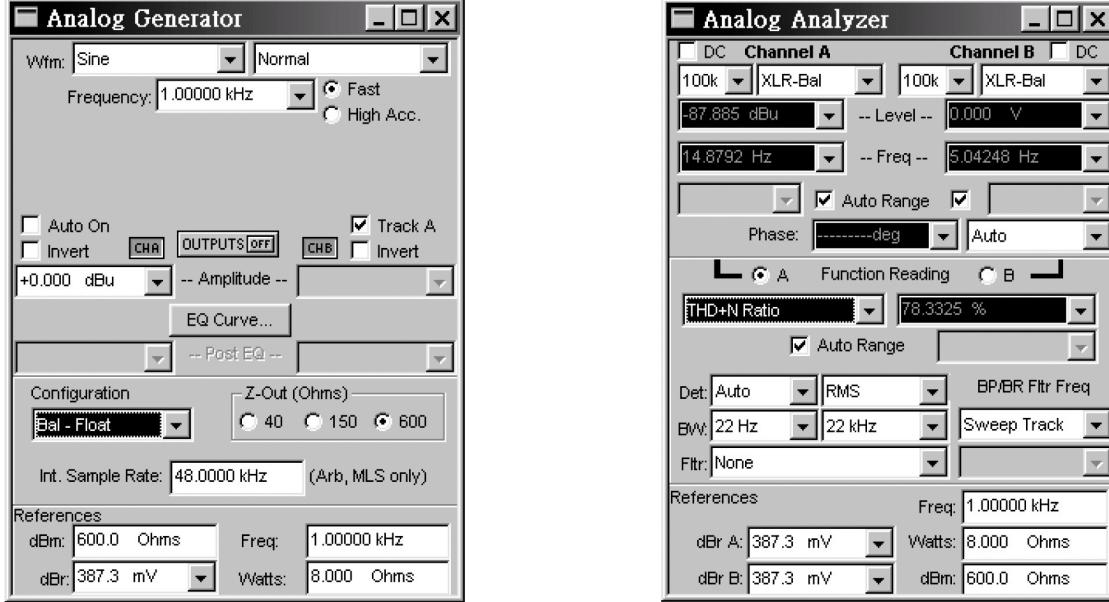

6. Adjust the input level so that the AP output is 0dB, press the Low Pass button and the frequency response is as following.

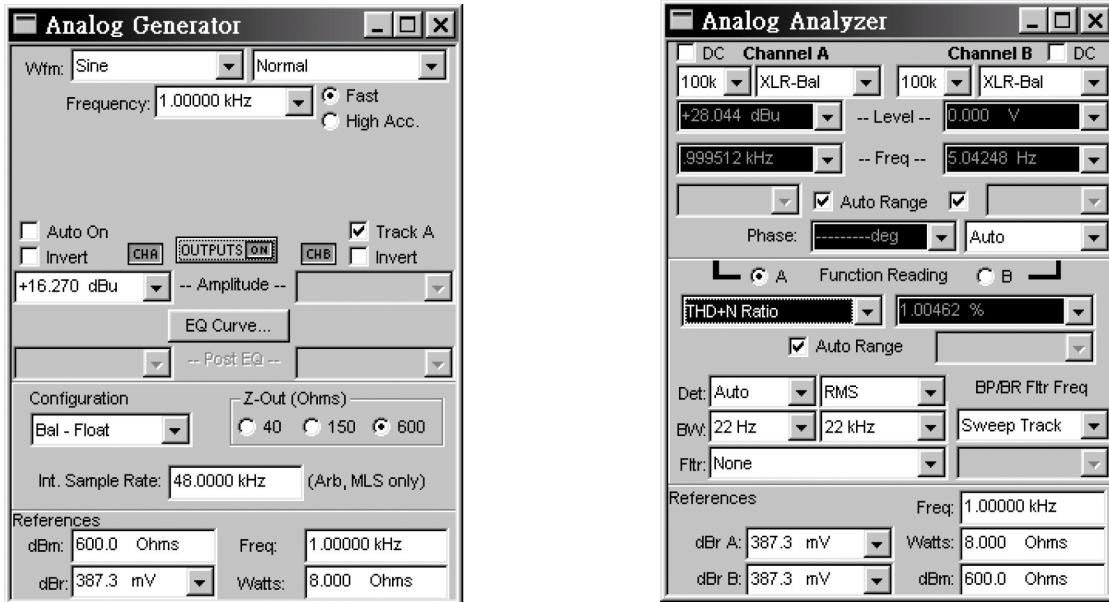

7. Press EQ button down, keep RANGE out and the LED indicates +12, adjust all slide buttons to maximum and minimum, measure the frequency response independently and the curve shall be as following.

8. Turn off the AP input signal and set input level at maximum, the AP setting is as following, now, it shall be no more than -82dB.

9. Turn on the AP input signal, and set the input level at maximum, the AP setting is as following, the maximum non-distortion level is +28dBu/+/1dB and distortion is 1%.

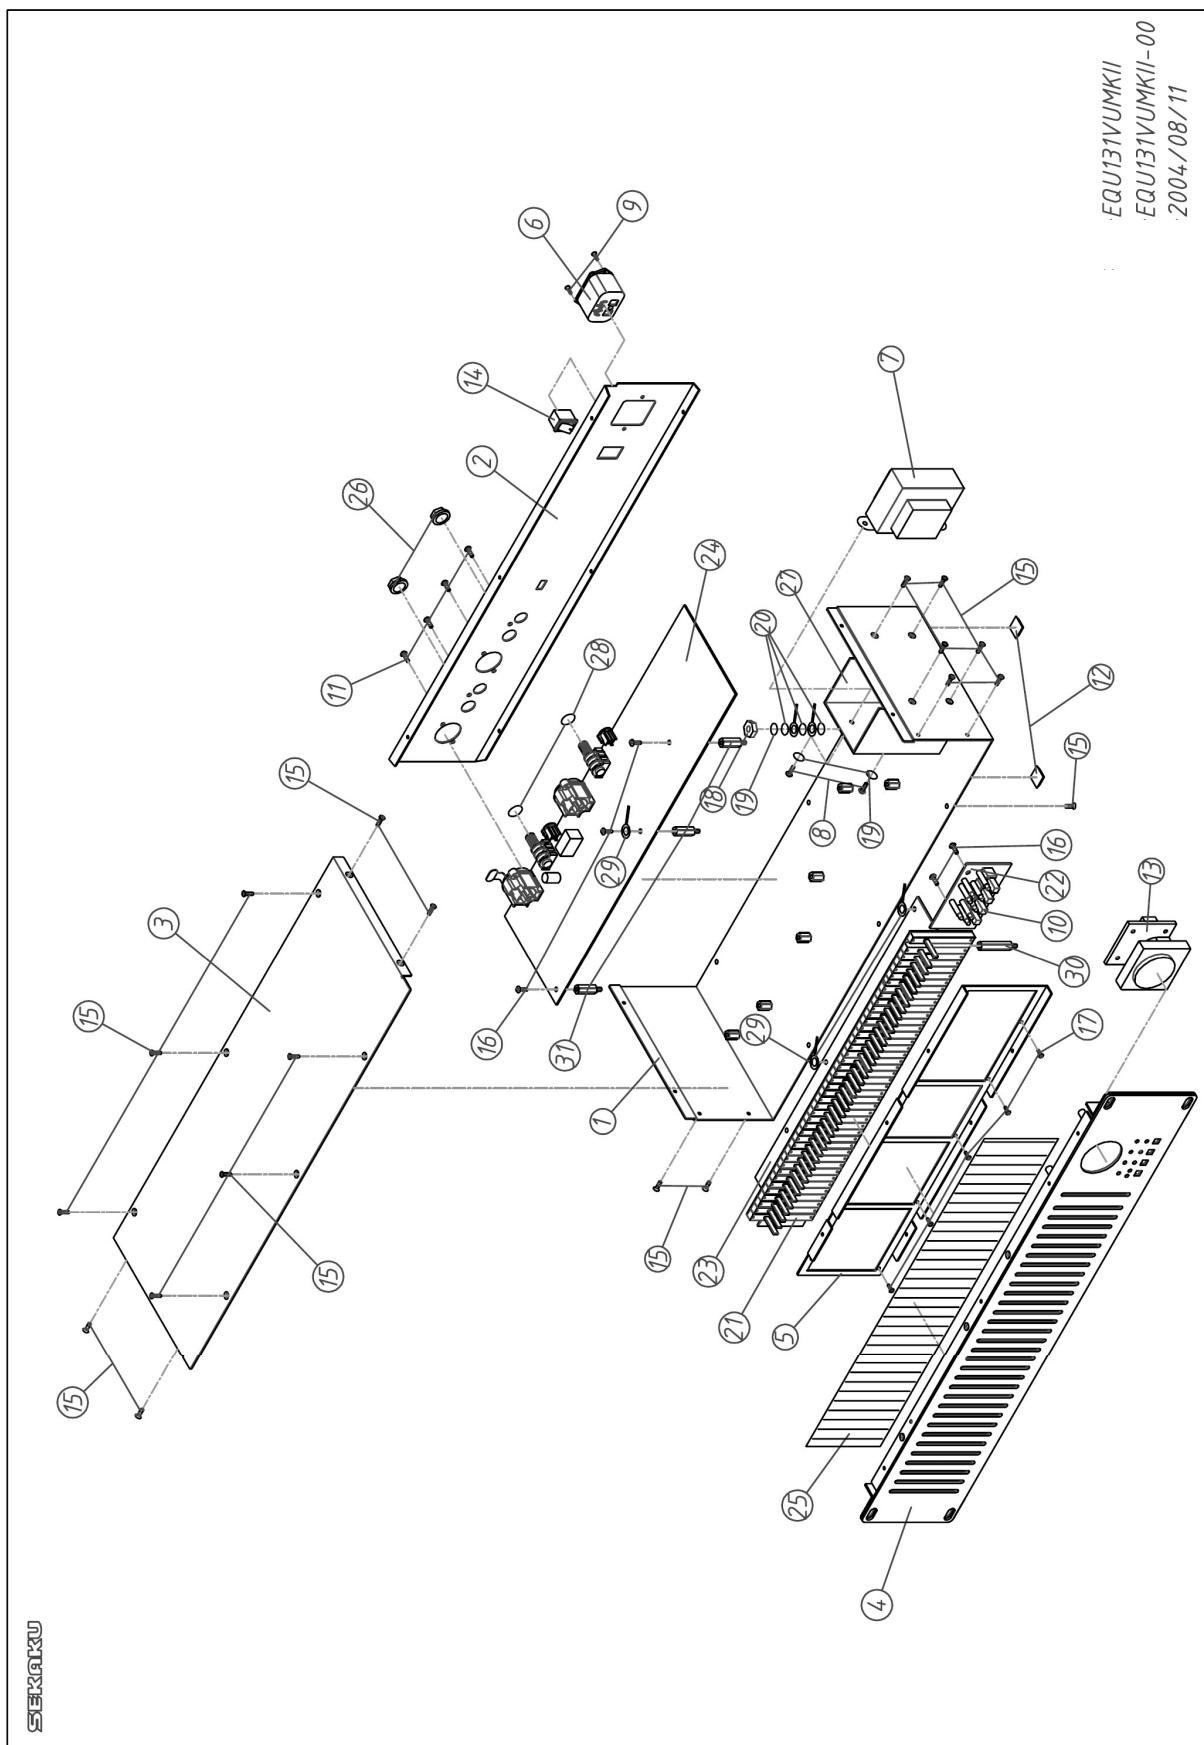

10. Now, the S/N shall be not less than 110dB.

11. Input a 0dBu signal, adjust the INPUT LEVEL to 0dBu, and AP output shall be 0dBu, now it shall indicate 0dBu on the VU meter.

12. All slides shall be set in center and all buttons out before shipping.
