CD23 (Text) Service Guide

Fault diagnostics

Fault	Action
No power	Check mains fuse Check power supply rails
No Audio output	Check for digital output, if ok then check power supply voltages Check DAC chip
Intermittent noise on output	Check Dac chip
Fails to respond to commands	Check supply to remote circuit Check remote flex foil cable Check for +4.9volts on RX201 o/p
Fails to read disc	Check mech supply Check clock signal
Laser optic moves to end stop position	Caused by failure of clock signal to the mech Check mech supply Check clock signal
No Display	Check filament voltage 3.1vac Check flex foil cable Check for dry joints on micro and display
Spurious display readout	Check for dry joints on display board

Power supply test points

Position	Voltage
DGND	0 volts
PL202	+12 volts
PL204	-12 volts
IC200 o/p	+7.3 volts - mech supply
IC203 o/p	+5 volts - DAC supply
IC202 o/p	+5 volts - Digital supply
IC204 o/p	-30 volts
Between R227 & R228	3.1 volts AC – display filament

Hints & tips

- Voltage conversion 230/115VAC by changing the internal fuse position and fitting the correct rated fuse. 100VAC requires a different transformer.

Main Board L935

CD23 (text) Circuit Description

Power Supplies Transformers

115/230 VAC:

- Main board - part number L859TX
- Toroid - part number L860TX

100 VAC:

- Main board - part number L862TX
- Toroid - part number L883TX

Main board transformer secondary windings:

1. 9V-0V-32V to produce the digital, motor drive and fluorescent display grid supplies
+11V(U) Unregulated supply for relay drive and +5V(D) supply
+7V (IC200) Mechanism and motor driver supply
+5V(D) (IC202) General digital logic supply
+5V(A) (IC203) Supply to DAC
-30V (IC204) Display grid voltage.
2. 0-5V to provide an AC supply for the display filament.

Toroid transformer secondary winding:

1. 13.7-0V-13.7 for audio output circuitry (DAC)

Relay Mute Control

This circuit drives a relay to un-mute the analogue output ~5 seconds after the unit is powered on, and quickly mutes the output when the unit is switched off. The circuit works effectively as an "AND" gate.

If AC is present on the transformer secondary winding and the 5-second timer composed of R222 and C221 has reached the threshold voltage (V_{be} of TR200 + V_{be} of TR201 - V_{ce} of TR202, or ~1.0V), the relay coil is connected to +11V (referenced to 0V₃ as required by the DAC's internal circuitry) via TR204.

When AC is removed, C231 discharges quickly through R225, the base voltage of TR204 rises and the relay coil voltage is removed, muting the output. TR203 resets the 'timer' by discharging C221 quickly at turn-off.

Remote Control/PIC Micro

Remote control data is received from the IREye on the display PCB and buffered by TR300 and TR301. The Programmable Interrupt Controller converts the RC-5 format data into the NEC format required by the Sony micro. The PIC also controls the configuration of the digital filter/DAC on the DAC board.

Motor Driver

The status of the drawer is indicated to the micro by two micro switches 'INSW' and 'OUTSW' on SK205. The micro controls the drawer motor via driver IC303.

Clock Buffering

The clock and data signals LRCK, ADATA and BCLK from the mechanism connector SK300 are double buffered by IC300 before being delivered to the DAC.

Power-On/Reset

The power-on reset signal XRST (or RESET) is generated by R409, C410 and IC404. When the power is turned on, C410 is initially uncharged and pin 11 of IC404 is at high voltage, and thus the output is low. After a short time, C410 is charged via R409; IC404 pin 11 is then low, and the output switches high (RESET is de-asserted).

System Clock

The system clock is generated on the DAC board.

The clock and data signals LRCK, ADATA and BCLK from the mechanism connector SK300 are double buffered by IC300 before being delivered to the DAC. The system clock is delivered to the mech via two-position jumper PL300.

Microcontroller & Display Board

The system microcontroller IC100 serves the following functions:

- Control of the mechanism & decoder on the CDM14 mechanism
- Control of mute, attenuation and de-emphasis for the DAC
- Direct drive of the fluorescent display
- Remote control decoding
- Keyboard scanning
- DAC muting

The keyboard scanning works by connecting the keys to a resistor ladder on an ADC input to the micro. Pressing a key presents a unique voltage to this input, which the micro is pre-programmed to interpret accordingly.

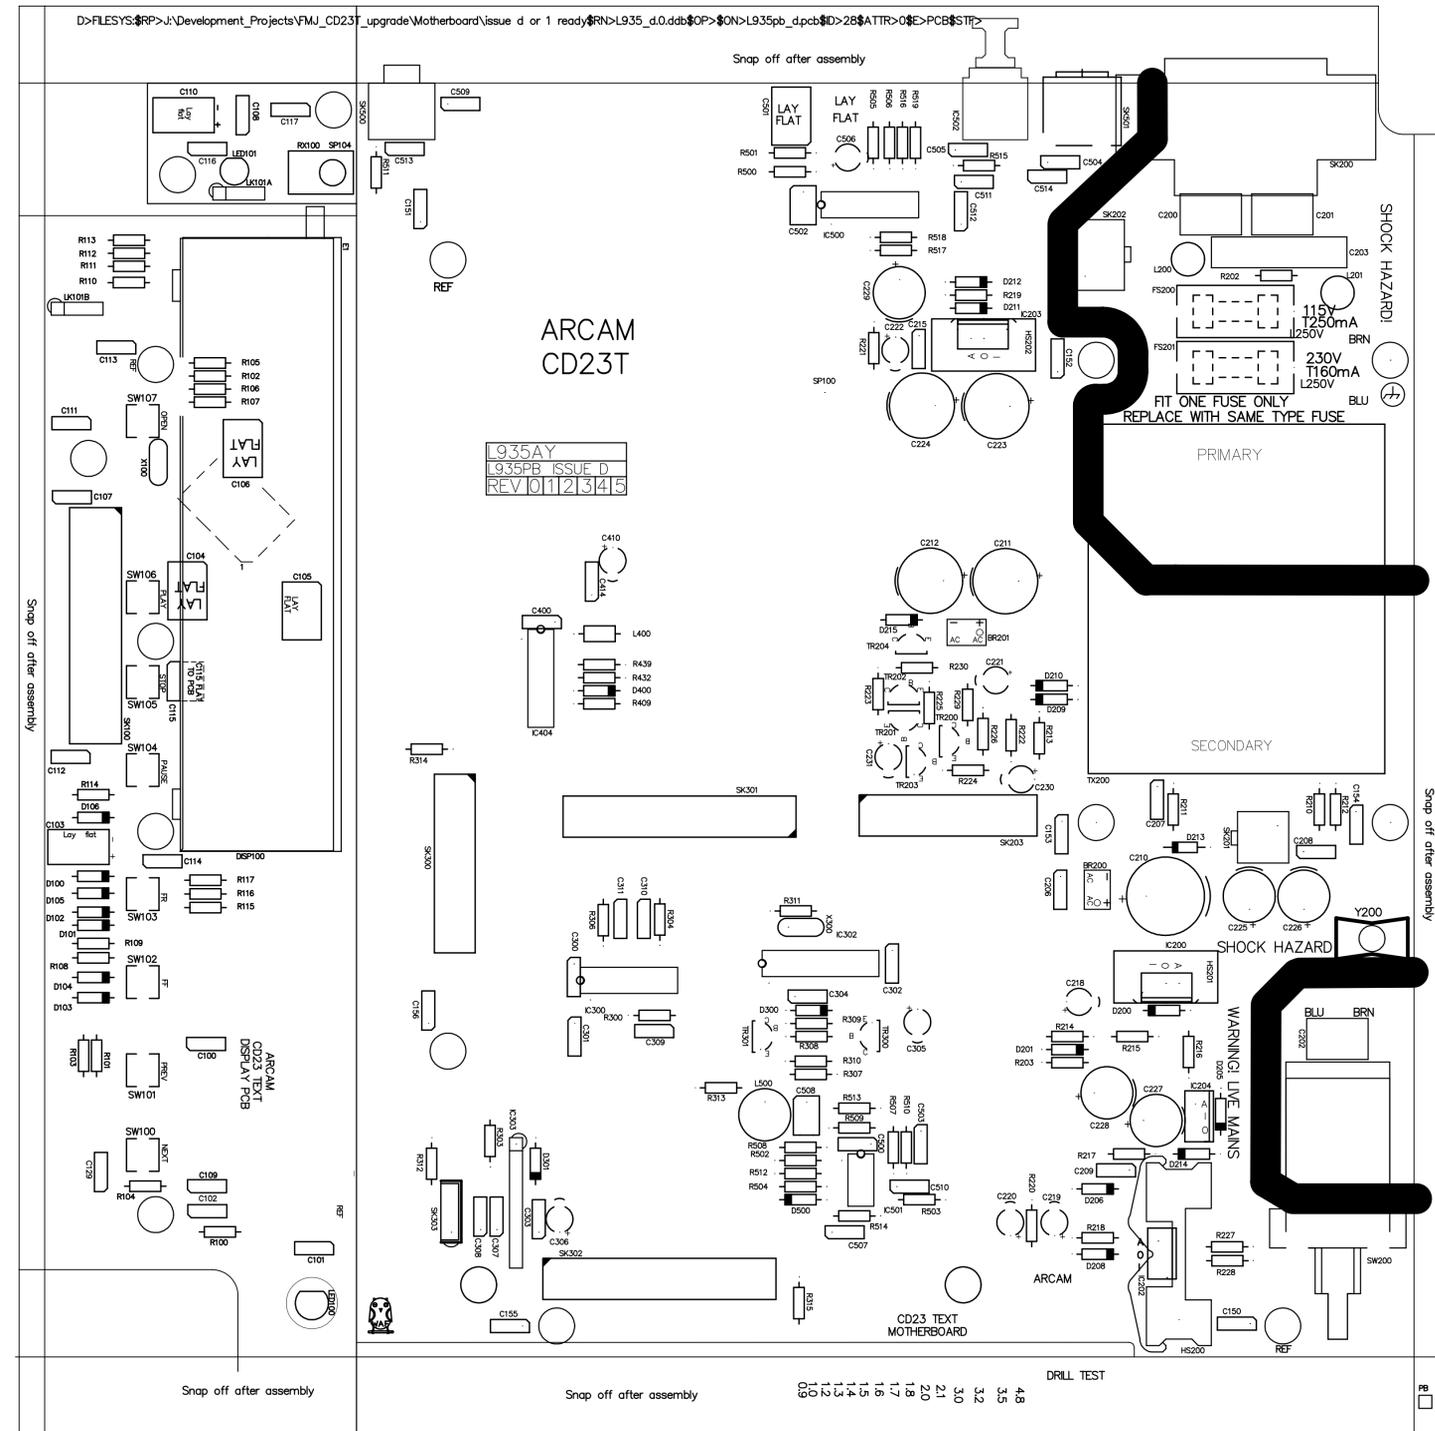

The remote control data contains a 'Customer Code' that identifies this as an Arcam product. The diode network D100 to D106 configures the micro to accept this code.

Remote Bus Carrier Filter & Demodulator

Remote control commands can be delivered over wire to SK500 for multi-room applications. Incoming signals are attenuated and clipped by resistors and D500. L500 and C508 form a parallel resonant circuit at approximately 37kHz. This demodulates the incoming signal and the output is passed to IC501A where it is 'chopped', low pass filtered and fed to IC501B to provide the RC5 output signal.

Digital Output

The decoder on the mechanism assembly generates an SPDIF format digital output signal. This is passed to buffer IC500A. IC500B through E are used in parallel to provide a transformer less 75-ohm source impedance to a single phono socket SK501. Optical digital output via IC502 is also tapped off the digital output signal via IC500F.

DAC Circuit description

Refer to L912 circuit diagrams

The DAC PCB converts Sony format digital audio data at 44.1KHz sampling rate to unbalanced audio outputs. There is a Pacific Microsonics PMD-200 HDCD filter which is programmed by a dedicated on board PIC micro (IC406) to accept a variety of data formats.

Digital Filter/HDCD decoder

The FPGA receives two control lines from the main board PIC, RB0 and RB6.

RB5 MS1, Serial data mode select 1. Used just after switch-on.

RB4 MS2, Serial data mode select 2. Used just after switch-on.

The PMD 200 (IC 400) receives Sony format serial digital audio data (after re latching) mute and de-emphasis control signals from the main board. The output from this is 8x over-sampled filtered audio data with a 24 bit word length. The HDCD filter output is in serial form BCKO, WCKO, DOL and DOR.

Data Re-latching

The PMD 200 (IC 400) requires that the input data is timed with respect to the system clock, however the data edges are not well defined when clocking at the system clock frequency so a re-latching circuit, IC300, IC 401, IC402 and IC403, re-clocks SER_CLK, SER_DIN and SER_CH to double the bit clock frequency. The phase of the latching clock is nudged if it's rising edge gets too close to the bit clock transitions.

Reset Signal

The XRST reset signal from the mother board is buffered by IC 300D & E to produce the GO signal. C127 at the input of the buffer delays GO from falling when the unit is switched off so that the mute relay has chance to close before any clicks occur.

The GO signal enables the clock output, initiates PMD 200 and FPGA programming and enables power and bias to the DAC ASIC.

Power Supplies

TR7 and TR5 regulate the supply to +/-13V with about 0.2V drop-out margin.

Voltage Reference

A voltage reference, IC 62, is used to derive the +/-13V rails as mentioned above and also a clean 5V supply to the DAC from IC 5. The reference is filtered and can be divided by two if TR 19 is switched on to provide the 6dB gain shift required by the HDCD filter(IC 400). This reference is used to drive the DAC reference point and the bias sources for the DAC.

Mute Relay

The mute relay is controlled from the PIC micro on the motherboard via RA0 after switch-on. In Standby mode, XRST is low which interrupts the relay via TR 25. RA0 is low when the CD player comes out of standby mode and goes high after a short settling delay. TR 18 is also used to interrupt the relay while the FPGA is not fully programmed.

The power rail, RLYPWR, is un-regulated and has a small reservoir capacitor (on the mother board) so that the relay is released very soon after the mains is disconnected from the CD player before the other power supply rails collapse.

FPGA noise shaper

The FPGA (IC61) is programmed by the PROM (IC31), which holds the configuration code, to perform the function of reading in the 8x over-sampled audio data from the HDCD filter and output the noise-shaped and encoded data to drive the ring DACs. This happens after the PRGMN line and the GO signal goes high.

Ring DAC

The ring DAC (IC 63) re-latches the data from the FPGA to a clean latching signal gated by U21 to the system clock. The data is then driven through buffers into resistor rings, which effectively form the 48 current sources, into a virtual earth point. Bias currents are also injected to compensate for the way the ring data is encoded. The earth point is held at half the voltage reference voltage 2.5V or 1.25V depending on the HDCD gain shift state. This level is generated by a matched resistor divider on the chip.

Voltage References

The current switches in the DAC need two reference voltage levels per channel to switch each of the resistors between, 0V and +2.5/5V. The second reference can be switched between +2.5 and +5V depending on the gain required by the HDCD filter. The reference points must be kept at a very quiet DC level since any noise on these points is directly represented at the audio outputs. To keep these points quiet, op-amp servos, IC 8, IC 9, IC 24 and IC 25 drive them through discreet buffers. A second connection is made to the point on the chip which the op-amp uses as a sense line.

DC Bias

Because of the way the ring DAC works, not all the 48 current sources are switched on at any one time in each ring. On each channel, one ring has an average of 14 sources on and the other, the compliment, has an average of 34. DC bias needs to be injected into the virtual earths to null the current offsets. This is done by applying a DC voltage through on-chip matched resistors. The applied voltages must be either side of the virtual earth voltage which is half the reference voltage. The DC levels must also be proportional to the reference voltage. The bias voltages are sourced by IC 4 and IC 23.

Voltage Servo

A voltage servo, IC 22, ensures the audio output DC offset is nulled by varying one of the DC bias levels slightly via R16 and R115.

To ensure the servo has stabilized by the time the mute relays are opened, the time constant of the servo is drastically reduced while the mute relay is active by JFETs TR 27 and TR 28.

Analogue Stages

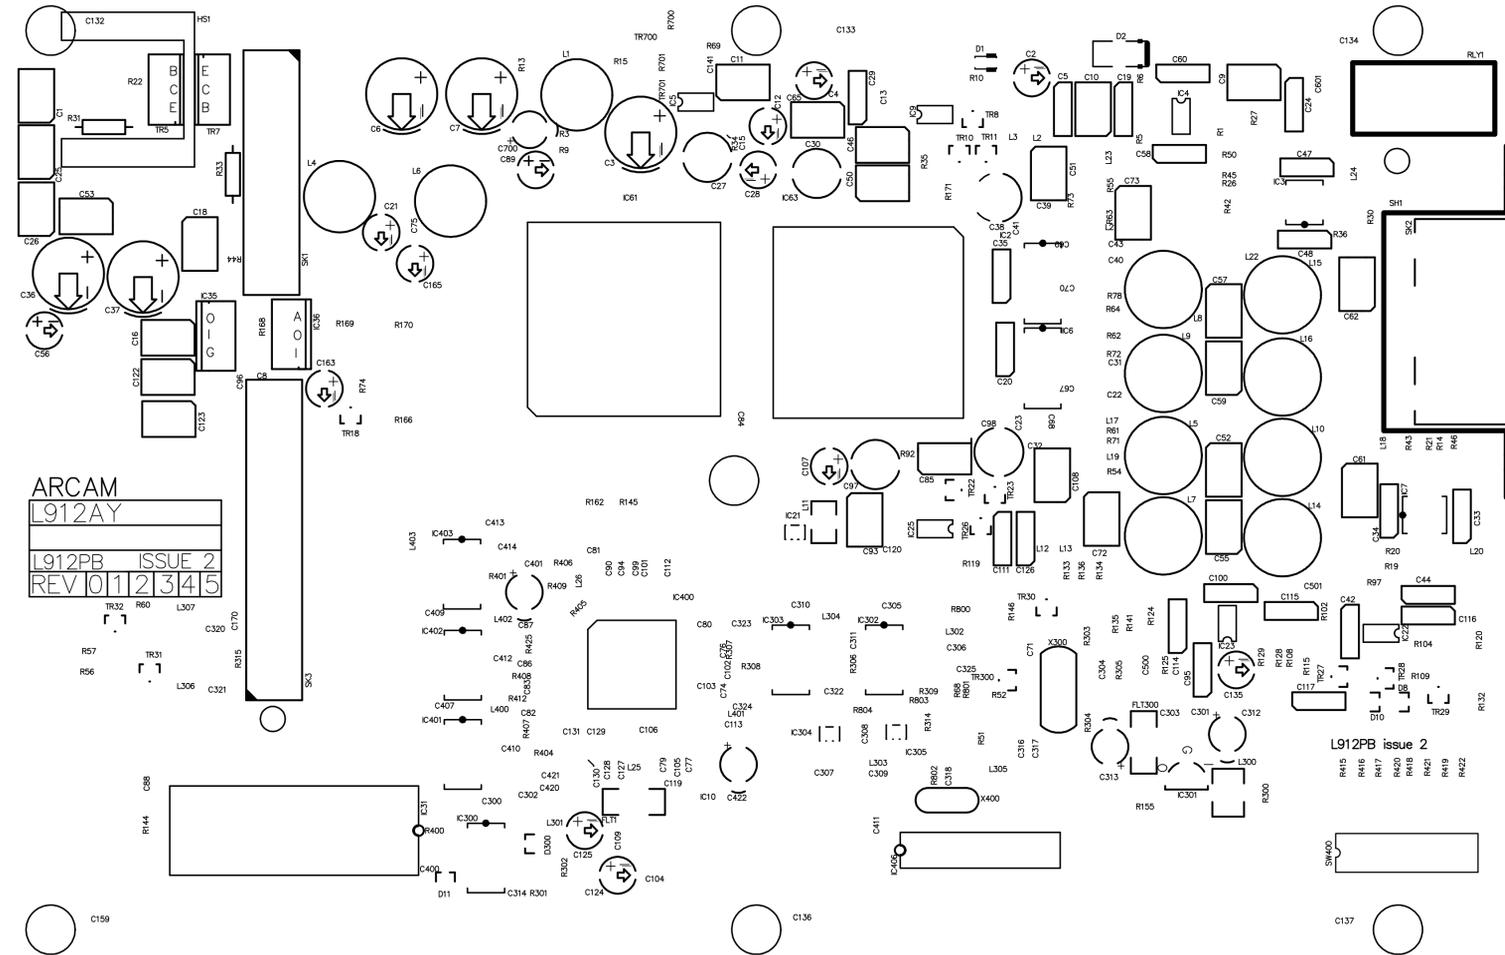

The DAC has two pairs of complimentary outputs. Each output is in the form of a virtual earth point which are then passed through a current feedback I/V stage (IC2 and IC6). The gain setting feedback resistor for the I/V stage is on the DAC chip matched to the resistors in the DAC ring.

The complementary signals are then passed through a differential 4 pole passive LP filter with a Bessel characteristic which removes a large amount of digital (ultrasonic) noise while causing minimum disruption to the audio band. They are then combined with a low distortion differential buffer amplifier to produce a single ended output (IC 3 and IC 7).

Specifications

Type of DAC	:	DCS-designed ring DAC ASIC with a 4 rings of 48 current sources.
DAC source	:	Encoded current source drive from FPGA. 14 of 48 current sources active on average on two rings & 34 of 48 on the other two.
0dB Output Level	:	2.3V rms (4.6V for HDCD mode) +/- 0.2V rms @ 1KHz.
Frequency response	:	10Hz to 20KHz +0,-0.2dB.
THD	:	0.01% typical, 0.018% max @ 1KHz 0dB output. 0.05% typical, 0.06% max @ 1KHz 0dB output in HDCD mode
Signal to Noise	:	Better than 93dB CCIR uwtd ref 1KHz 0dB, Better than 97dB A weighted ref 1KHz 0dB. (Hoping to improve, please consult SJB before publishing).
Crosstalk L/R	:	Better than -98dB at 1KHz 0dB
Output offset	:	<20mV d.c.
Output Impedance	:	47 Ohms o/p to drive load 600 Ohms minimum.

Transformer Specifications

Contents

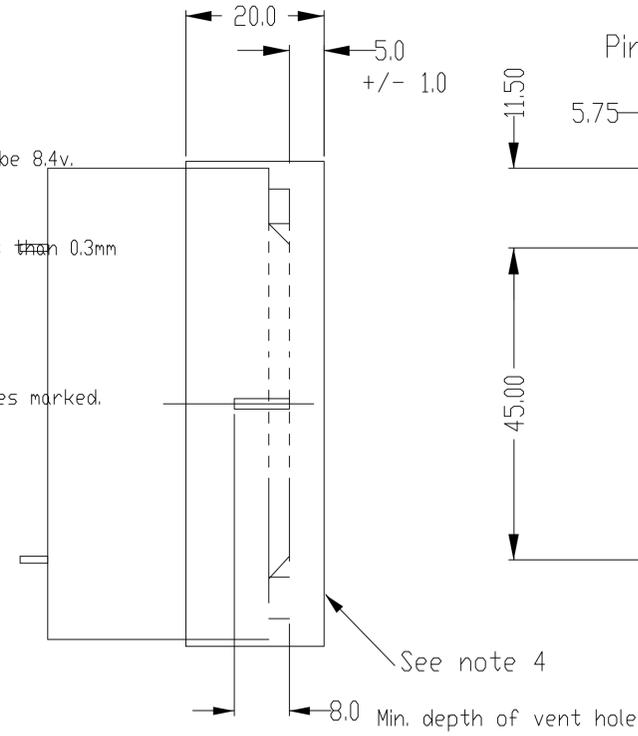

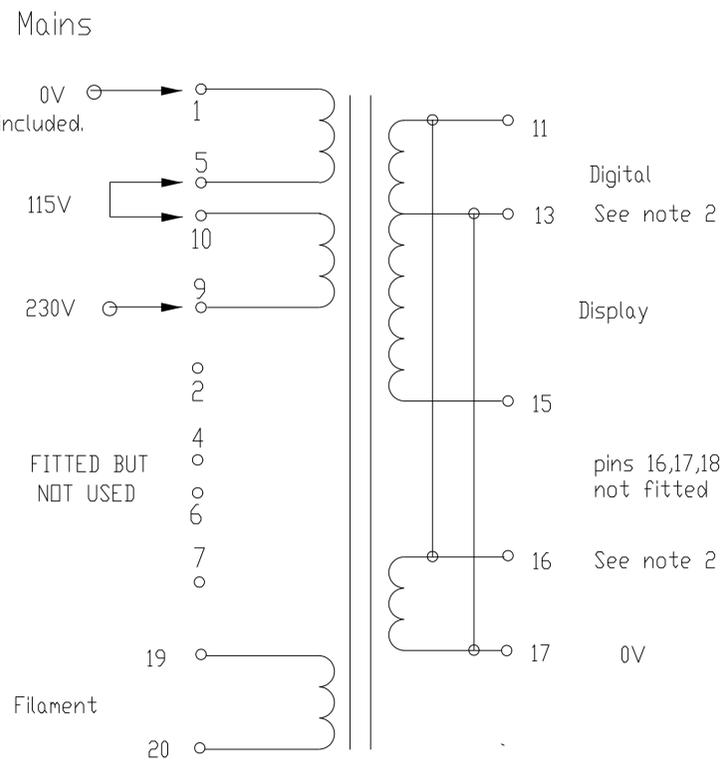

- **L859TX**
- **L860TX**
- **L883TX**

Notes

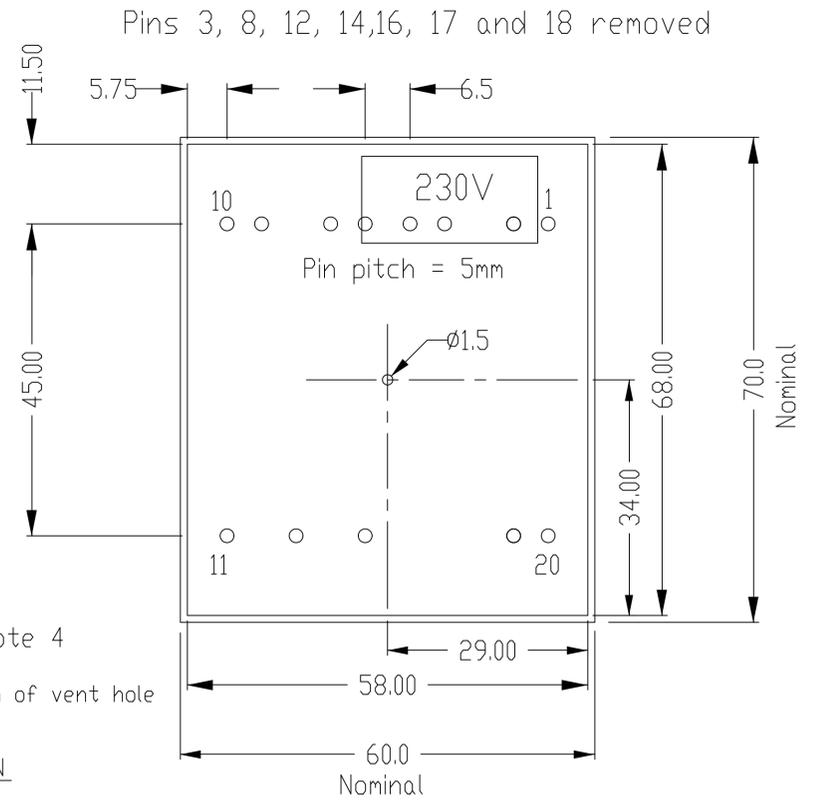

- Mains primary consists of two equal windings wired in series.
- Output for windings 11-13 and 16-17 must have as good a regulation as possible.
The DC output required is 11.6V after a bridge rectifier, using a 3300uF reservoir capacitor, at 500mA load.
Nominal load current : 470 mA. Peak load current : 850mA. The minimum DC voltage at full load and 198v should be 8.4v.
- Bobbin type UI39 x 21mm
- Fit three layers of approx 0.3mm thick Silicon Steel core strip around TX where shown ensuring a tight fit (less than 0.3mm clearance typically). Then cover with black crepe tape and fill well with potting compound/varnish as necessary.
- A hole must be drilled where shown to vent gasses when hot.
- Stick a 25.5 x 12.7 label on top of TX where shown. Label to have black text on white background.
Label to have voltage (large underlined text) Arcam part # and manufacturers name, part # and any date codes marked.
- Pins 17 to 13, 16 to 11 linked internally.

Pins not specified in table should not be included.

PIN No's	VAC	AT LOAD
1	0V	Mains
9	230V	"
19	0V	Filament
20	5.0V	150mA
15	32V	50mA
13	0V	
11	Note 2	1A
16	see note 2	1A
17	0V	

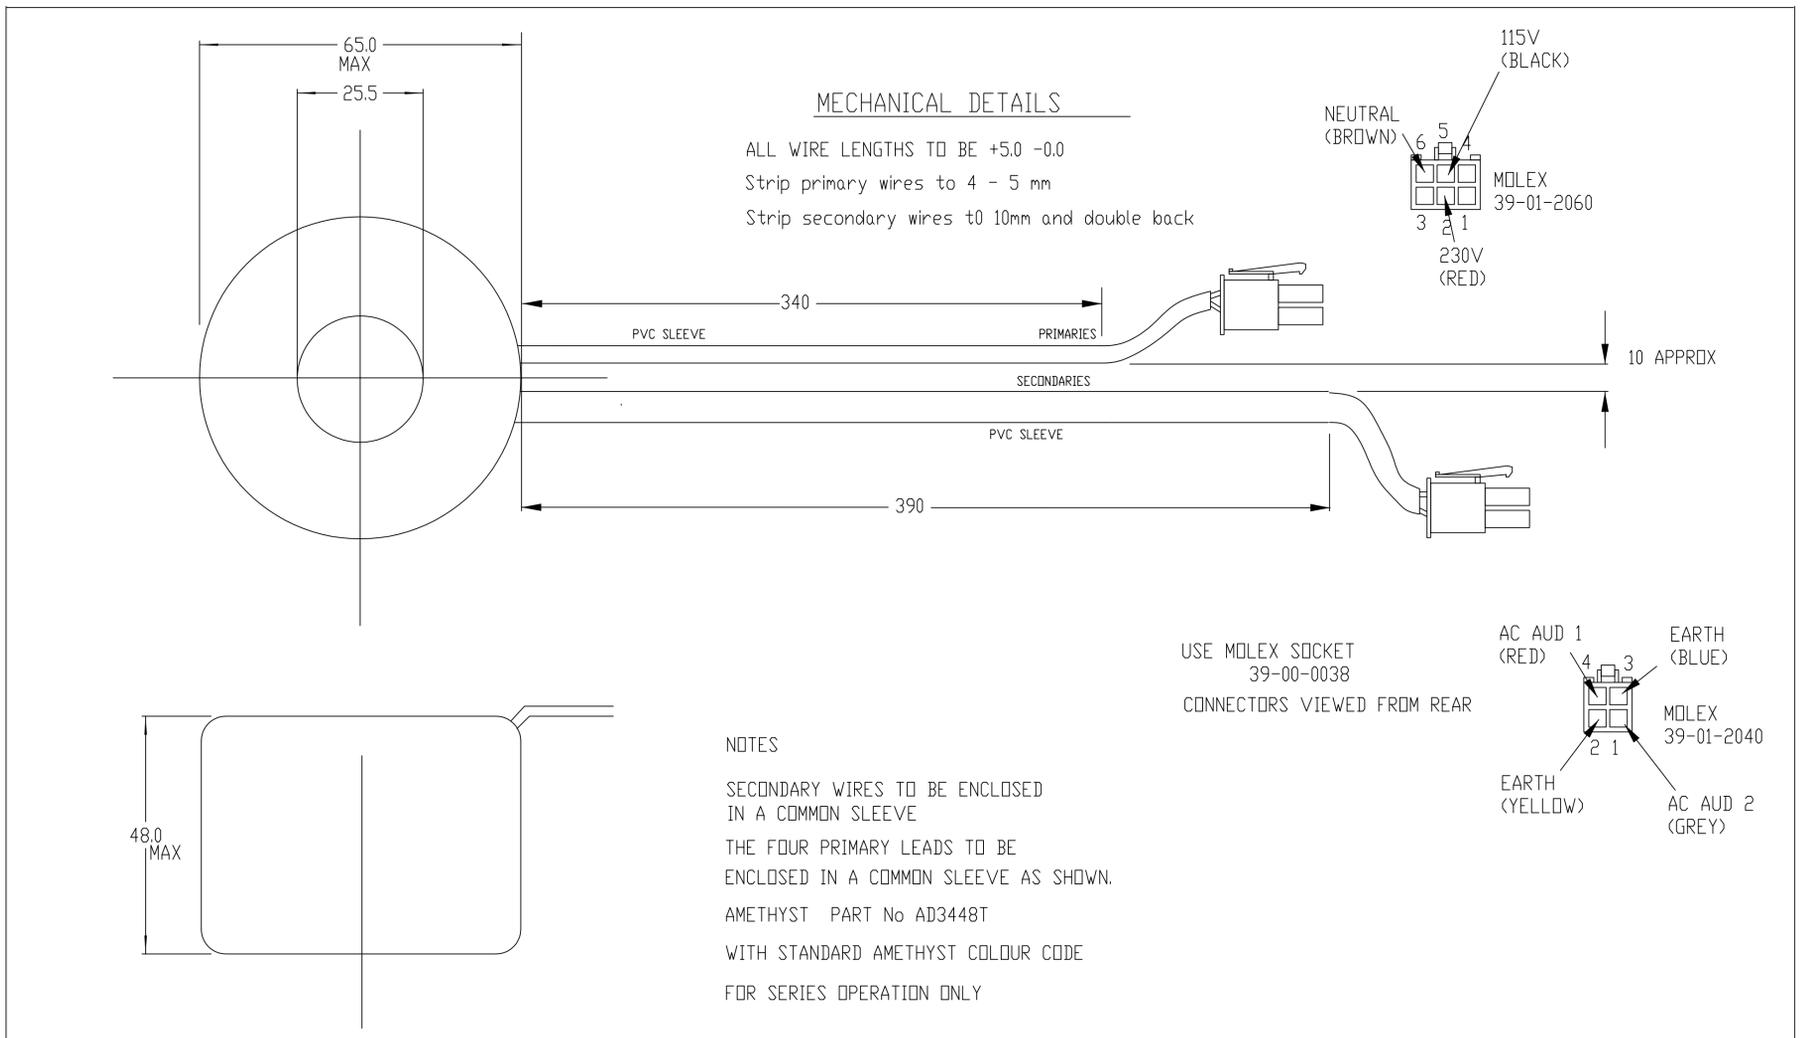

Mechanical details, viewed from top of transformer

ELECTRICAL SPECIFICATION

- FREQUENCY :- 50 - 60Hz
- INTERWINDING SCREEN :-
- SECONDARY WINDING :-
 - Regulation (AC)/load current -
 - Continuous VA rating @ 230v
 - Voltage unbalance -
- GENERAL
 - Magnetic radiation LOW & CONSISTENT
 - Acoustic noise THE DEVICE SHOULD BE DESIGNED TO BE AS QUIET AS POSSIBLE.
 - Maximum ambient temperature 50° C
 - Application POWER SUPPLY FOR CD PLAYER USING BRIDGE RECTIFIER AND 3300uF/1000uF CAPACITORS. QUIESCENT LOAD 300mA DC.
- SAFETY APPROVAL :- To meet BS415/IEC65

ELECTRICAL SPECIFICATION

- FREQUENCY :- 50 - 60Hz
- INTERWINDING SCREEN :- NO
- SECONDARY WINDING :-
 - Continuous VA rating - 15VA
- GENERAL
 - Magnetic radiation - LOW AND CONSISTENT.
 - Acoustic noise VERY LOW (INAUDIBLE AT 2m IN A QUIET ROOM ON QUIESCENT LOAD)
 - Maximum ambient temperature - 50°C
 - Application POWER SUPPLY FOR CD PLAYER USING CIRCUIT SHOWN ABOVE
 - Supplier Pt. No. - AMETHYST PART No. AD3448T

FOR SERIES OPERATION ONLY
- SAFETY APPROVAL :- To meet BS415/IEC65 Class II, EN60742/BS3535, UL506 & C22.2 No. 66-1988
