

COPLAND

VALVE AMPLIFIER

SERVICEMANUAL

FOR

CTA - 505

Bias adjustment for Copland CTA-505:

1. If you put in a new set of tubes, you should first turn all 4 bias-adjustment potentiometers P1-P102, fully in counter-clockwise direction.
2. Turn on the amplifier, and let it warm up for 1 minute.
3. Connect a voltmeter (on mV measuring range) with - to chassis ground (use the earth point situated between the main power- transformer and the right outputtransformer)

Connect the positive + test-probe from multimeter to point S left, for measuring Bias for tube V4 and adjust with P1 to 45 mV.

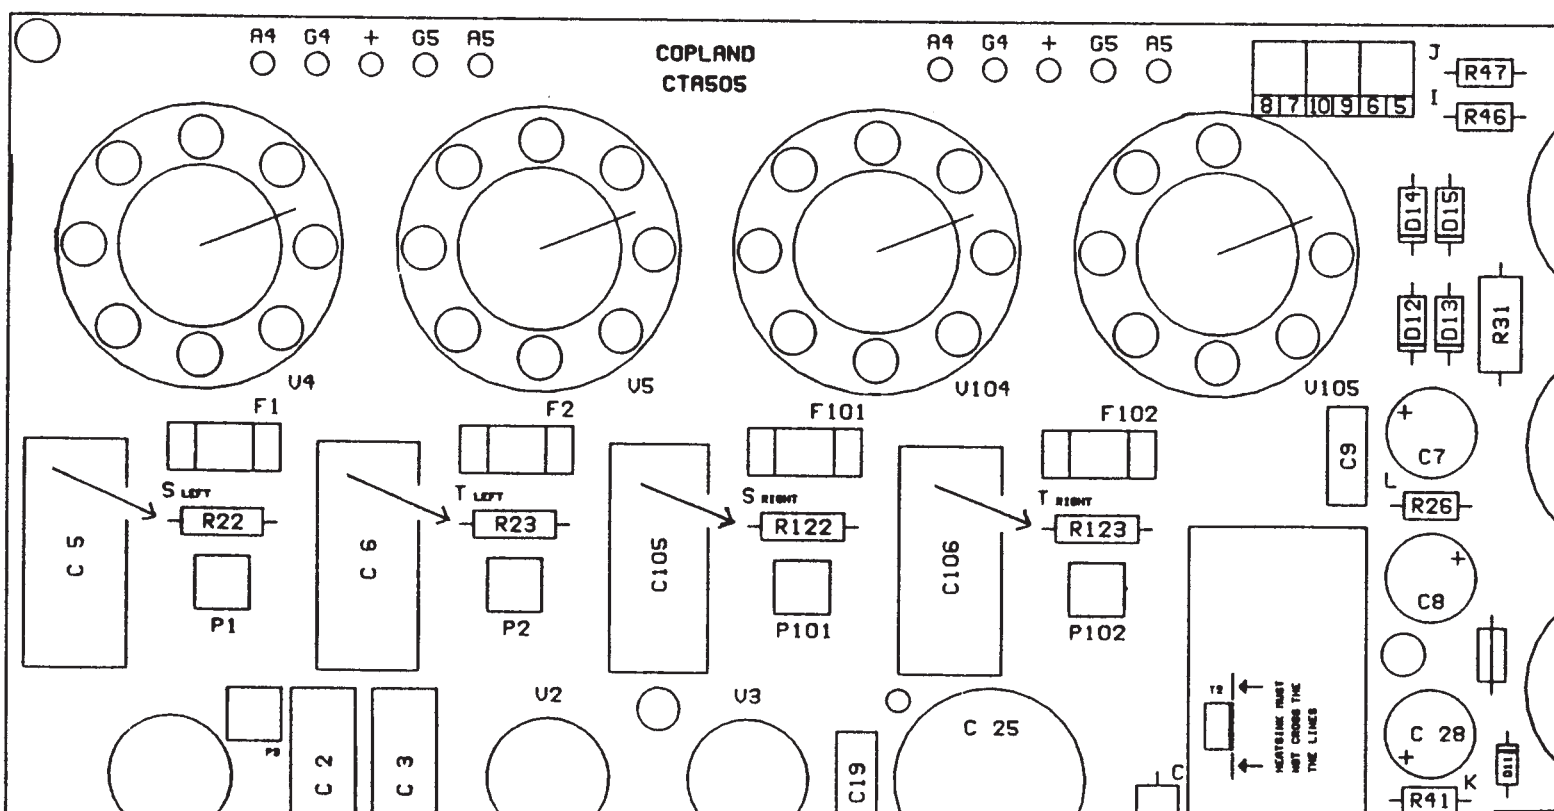

For tube V5 the measuring point is T left, and adjustment is done with P2

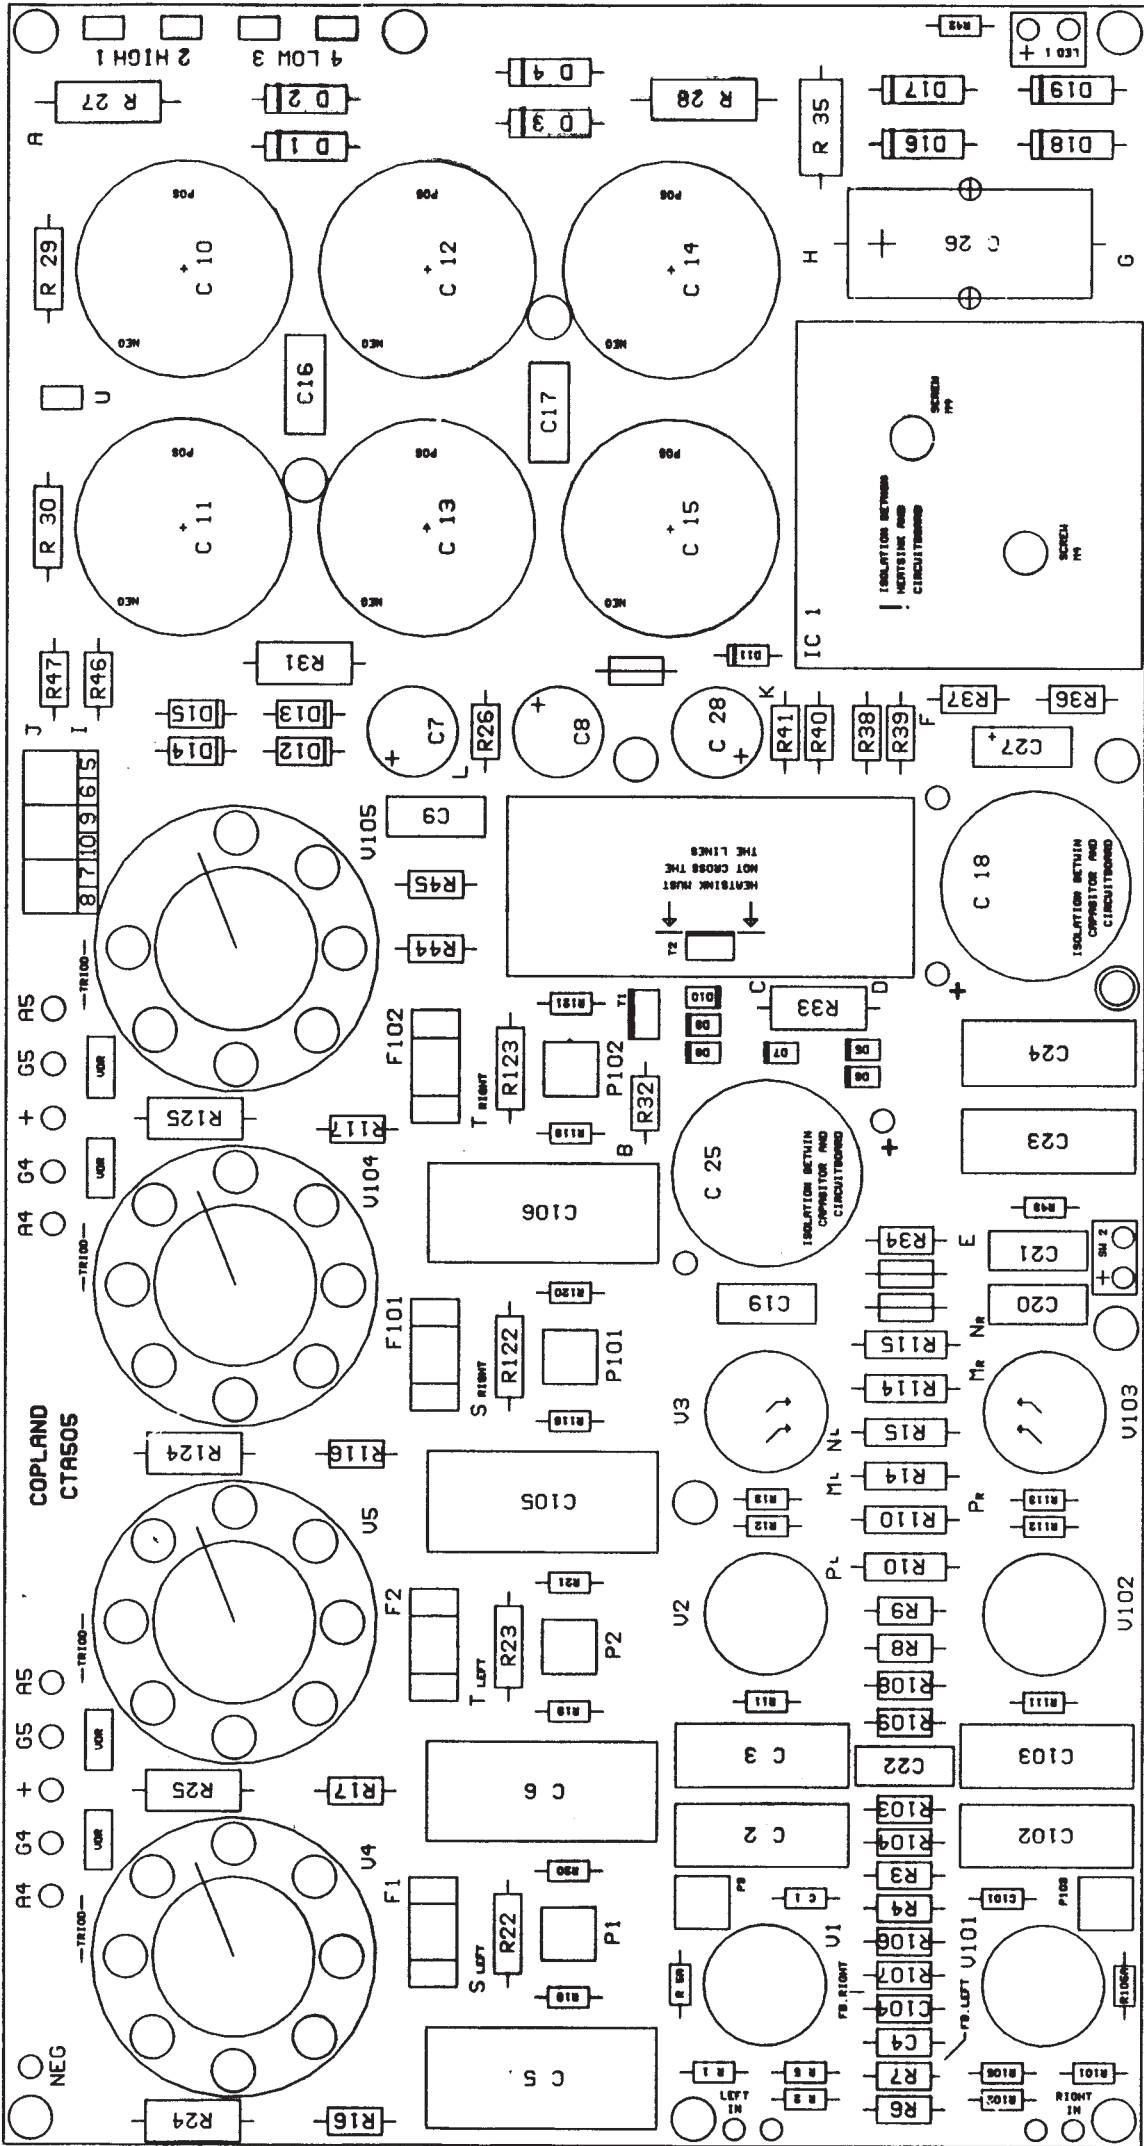

For tube V104 the measuring point is S right, and adjustment is done with P 101.

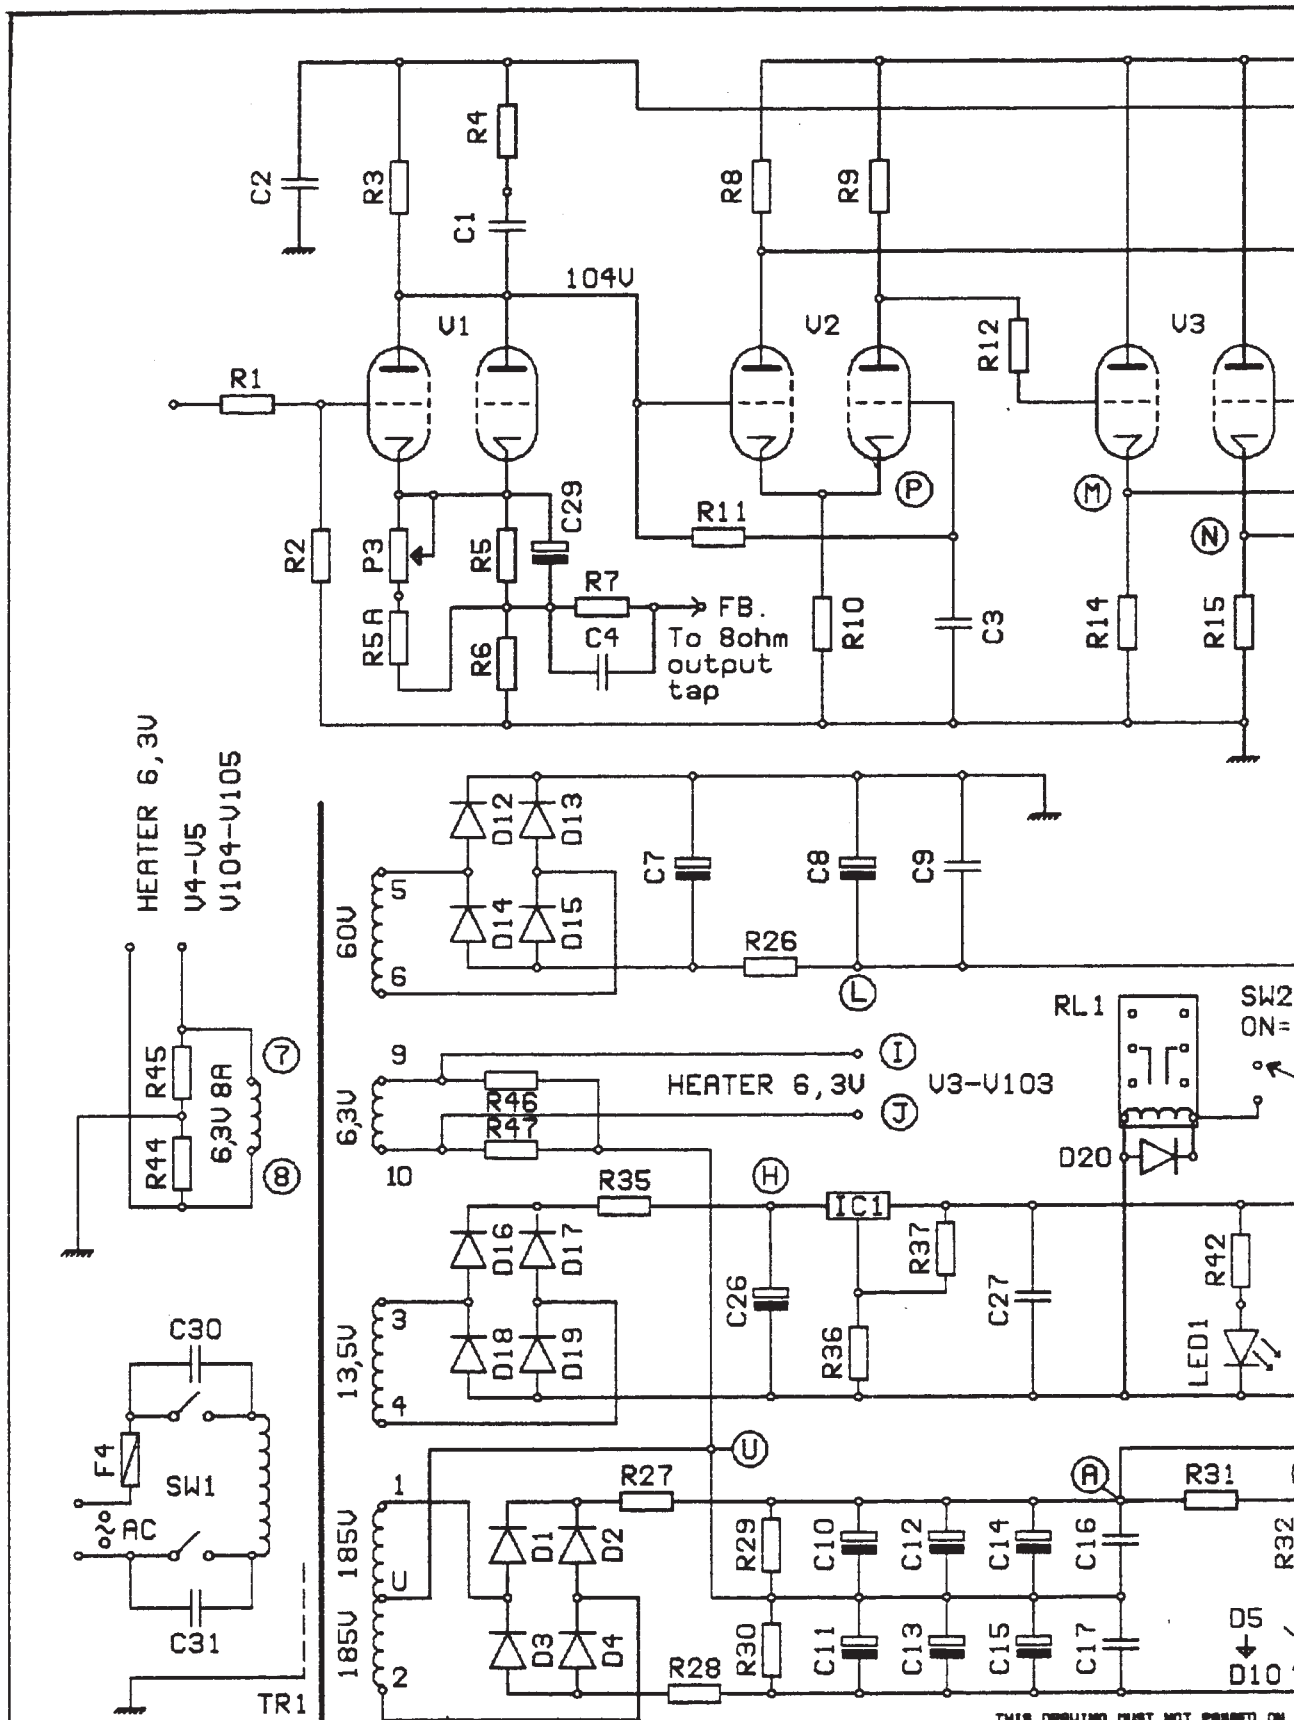

For tube V105 the measuring point is T right and adjustment is done with P102.

When you have adjusted all 4 tubes, please repeat, as the adjustment of one tube, affects the other tubes slightly.

4. Let the amplifier heat for 30 minutes, then please repeat point 3.
5. If the tubes have been used for some time, the bias should already be close to the right level, so you can start bias-adjustment at point 2. (You don't need to do point 1)
6. 45 mV = 45 mA per tube (same value for all 4 tubes)
