PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in this chassis have special characteristics. These characteristics often pass unnoticed and the protection afforded by them cannot necessarily be obtained by using replacements components rated for higher voltage, wattage, etc. Replacement parts that have these special safety characteristics are identified in this manual and its supplements; electrical components having such features are identified by a ⚠ in the schematic diagrams and the parts list. Before replacing any of these components, read the parts list in this manual carefully. The use of substitute replacements parts that do not have the same safety characteristics as specified in the parts list may create shock, fire, or other hazards.

5. MECHANICAL ADJUSTMENT

General Remarks

Before attempting to adjust the mechanism, wipe clean all type contacting surfaces (Pinch Rollers, R/P Head, Erase Head, and Capstan) as well as the contact surfaces of the driving parts (i.e., Motor Pulley, Fly-wheel and Cluth Ass'y) with a piece of soft cloth soaked in alcohol. Grease stains may cause trouble.

Caution

Never attempt to clean the drive belts (Capstan and FF/Rewind Belts) with alcohol soaked fabric, because. They are specially surface-treated.

Any belt which has been stained with grease should be replaced.

Take-up Torque Adjustment (Figure 7)

1. Insert a cassette torque meter and measure in playback mode.
2. If the take-up torque is not adequate (30 to 70 g-cm), wipe the flywheel and/or replace the capstan belt and take-up reel.

Fast-Forward Torque Adjustment (Figure 7)

1. Measure the fast-forward torque.
Torque of more than 55g-cm is necessary for fast—forward operation.
2. If the fast-forward torque is not adequate (over 55g-cm), wipe the flywheel, cluth Ass'y, and/or replace the RF belt.

Figure 7

Pinch Roller Adjustment (Figure 8)

1. While keeping the unit in the playback mode, measure the pinch roller contact with a spring gauge (0 to 500 gauge).
2. Hook the spring gauge to the pinch roller and pull it away from the capstan. Measure the force at the moment when the pinch roller comes in contact with the capstan (when the pinch roller starts revolving).
3. To adjust the contact pressure, bend the spring, and/or replace spring.

Figure 8

6. STANDARD MAINTENANCE

Whenever a unit is brought in for service or repair, it should be cleaned and the head should be demagnetized.

1. Cleaning: Clean the head and all tape handling surfaces using standard swabs. Wipes dry.
2. Demagnetization: Do not demagnetized tools near the head, since they can demagnetize it.
With normal use, the head will retain small amounts of residual magnetism which results in increased noise and loss of high-frequency response. Use a standard tape head demagnetizer to demagnetize the playback head.
3. Lubrication: Use a high-grade of specially formulated lubricant in the appropriate places. Lubrication is normally required only when parts tend to bind, or after long periods of use.
Use all lubricants sparingly and avoid contact with other parts.

7. CIRCUIT ADJUSTMENT
