Introduction

AS the owner of this Garrard Model 301 Transcription Motor you have a unit whose performance is supreme in its class and this manual has been prepared to enable you to enjoy and maintain the high performance which this motor can achieve.

Should you require any further information or advice not covered by this manual, please do not hesitate to ask your nearest Garrard agent or write to our Technical Service Department, Newcastle Street, Swindon, who will be pleased to help you.

THE GARRARD MODEL 301 TRANSCRIPTION MOTOR

Description

THE Garrard Model 301 Transcription Motor is the culmination of over 40 years' experience in the design and manufacture of high quality gramophone equipment, and this motor has been designed to provide the professional user and quality enthusiast with a unit supreme in its class.

The Model 301 Transcription Motor has three controls, the speed range knob on the right hand side, speed adjusting control in the centre and the on-off knob on the left hand side.

It has extremely low wow and flutter content, rumble being almost non existent. Each of the three speeds is adjustable by means of a knob which operates a specially designed eddy current brake to enable the precise speed to be obtained.

Great attention has been given to details appreciated by the connoisseur, such as a suppressor unit to avoid switch clicks, a heavy turntable diecast in aluminium and accurately balanced, a robust hardened and super finished turntable spindle, a fully retracting intermediate wheel and a brake to reduce the free revolutions of the turntable on switching off.

The unit is supplied complete with stroboscope, record adaptor for 7" large hole records and clip, a bottle of special oil, all fixing screws, set of spring suspensions, template, manual, and test report.

Operation

To operate the Garrard Model 301 Transcription Motor proceed as follows:—

- (1) Move speed range knob to desired speed
Diagram 1

- (2) Place record on turntable
Diagram 2

(3) Switch on
Diagram 3

To set speed place a record on the turntable and then place the stroboscope on the record. Start motor. Place pickup on record and turn the speed adjusting knob until the ring of lines applying to that speed for which you are setting appear to remain stationary when illuminated under an appropriate A.C. light source, Diagram 4.

For highly accurate transcription work where the slightest speed deviation is critical it is desirable to let the motor run for approximately 10 minutes so that it may reach its normal working temperature. For such critical work, speed should be re-checked on changing the speed range.

Diagram 4

To protect the intermediate wheel from damage the speed change knob is interlocked with the on-off knob. To change the speed range the motor must be switched off by means of the on-off knob.

The turntable must not be held stationary with the motor switched on and the on-off switch on the motor should always be used for stopping.

Technical Details

- Turntable** - Diecast Aluminium 12" diameter machined all over and accurately balanced.
Weight 6 lbs. Fitted with rubber mat.
A three speed stroboscopically engraved turntable is available at extra cost.
- Unit Plate** - Diecast Aluminium.
- Motor** - Shaded pole induction in heavy cast casing suspended on six tensioned springs. Magnetically screened.
- Voltage** - Dual Range 100 to 130 and 200 to 250 volts.
- Frequency** - 50 or 60 cycles according to motor pulley fitted. Alternative pulley available.
- Consumption** - 16 watts maximum.
- Wow** - Less than 0.2%.
- Flutter** - Less than 0.05%.
- Rumble** - Almost non existent.
- Speed Range** - 32 to 34, 44 to 46 and 76 to 80 r.p.m. approx.
- Finish** - High quality broken white enamel with black accessories.
- Size** - Motor Unit 14½" back to front, 13½" wide 2¼" above and 3½" below under surface of unit plate. Recommended size for motor board 18" x 18".
- Weight** - Nett. 16 lbs. Gross 20 lbs.

Instrumentation:—
Gaumont-Kalee Wow
and Flutter Meter
Type 564.
3,000 cycle constant
frequency records at
33½, 45 and 78 r.p.m.

Maintenance

The Turntable Spindle, motor and intermediate wheel bearings being of the oil retaining type rarely need lubricating. When however the need for oil is apparent remove the turntable and sparingly lubricate these bearings with a few drops of the oil supplied afterwards removing all surplus and making sure that no oil is present on the motor pulley or intermediate wheel before replacing the turntable.

These oiling points are indicated on Diagram 5, the oil recess in the top motor bearing being accessible through one of the three holes in the aluminium disc of the eddy current brake.

The motor must be in the switched off position before removing or replacing the turntable. The turntable is an accurate taper fit on its spindle and if difficulty is experienced in removing it the spindle top should be given a downward tap with a small block of wood, such as the handle of a screwdriver, while the turntable is lifted.

Diagram 6

Installation

The Garrard Model 301 Transcription Motor should be assembled to a substantial wooden motor board which should be cut out and drilled to the template supplied with each unit or to the dimensions given on Diagram 11. The motor should be assembled to the board, using the rubber washers supplied, between the unit plate and the board to prevent any distortion of the plate due to any possible inaccuracies in the board.

Insert the screws and assemble the washers and nuts as indicated in Diagram 5 tightening up the nuts equally a little at a time, then securely tightening up the lock nuts.

To protect the electric motor during transit it is firmly clamped by means of two transit screws, Diagram 5.

These screws, the heads of which are coloured red, must be unscrewed as far as they will go to release the motor clamp plate which allows the motor to float freely on its suspension springs. To clamp the motor for transit purposes the two motor transit screws should be tightened up.

The pickup to be used should be mounted on the board according to the manufacturers' instructions.

The motor should be fixed to the motor board as described above. This, however, may not always be possible due to the presence of extraneous vibration caused by shutting the cabinet lid or drawer or walking across the floor on which the cabinet is standing.

In these cases, the motor board should be spring mounted in the cabinet with the spring mounting assembly provided as illustrated on Diagram 7. The cabinet board being as shown in Diagram 8. With the motor and turntable in position, there should be a gap of about $\frac{3}{16}$ " to $\frac{1}{4}$ " between two boards. A reduced dimension template for this board is given in Diagram 12.

Diagram 7

Diagram 8

On final installation the motor should be levelled by adjusting the inner nuts of the spring suspensions, removing the lower nut, triangular washer, and lock nut to do so, replacing them when the unit is level.

The level should be checked by means of a spirit level placed on a record on the turntable.

A suitable set of four spring mounting assemblies is supplied with each transcription motor and they should be assembled as shown on Diagram 6. Should the motor board be thicker than $\frac{1}{2}$ " the fixing holes should be recessed $1\frac{1}{4}$ " diameter from underneath to bring the thickness of the board to $\frac{1}{2}$ " from the top.

Before assembling the motor into the cabinet connect the power supply lead, if not already fitted, to the power supply terminal block situated at rear of motor, making sure that the lead is securely clamped in the cord grip adjacent to the block. Check that the voltage range is set correctly for the power supply to be used; the links should be set as shown on terminal block cover and Diagrams 9 and 10. The motor pulley should also be

Set for 100/130 volts

Diagram 9

Set for 200/250 volts

Diagram 10

checked to see that the correct one for the frequency of the power supply is in position on the motor, a nickel finished one for 50 cycles, a brass one for 60 cycles.

Should the motor pulley require changing, remove the pulley on the motor by loosening the two grub screws holding it to the shaft and on fitting the other pulley check that it is in its correct position before tightening the screws, by moving the intermediate wheel inward, making sure that the rubber tyre runs in the centre of the appropriate step and its side face is clear of the pulley step face by $\frac{1}{32}$ " when set on $33\frac{1}{3}$ or 45 r.p.m.

The motor should be earthed by connecting a lead from the earthing tag on the motor, Diagram 5, to a good earth connection. For preference three core power supply lead should be used, two connections being made to the power supply terminals and the other to the motor earthing tag.

On final installation it is essential that the leads from the motor are not strained tight but should be very loosely looped so that the motor remains freely suspended on its springs.

The shaft of the speed range knob is extended so that a standard wafer switch may be fitted if required.

Service Adjustments

The Garrard Model 301 Transcription Motor has been designed to give reliable service with continuous use and these instructions have been included to enable the user to make the few minor adjustments which may become necessary after long periods of use in order to maintain the high standard of performance which this motor is capable of producing.

Intermediate Wheel.

The accuracy of the rubber tyred intermediate wheel is of supreme importance in maintaining the high standard of performance of the unit and should any wow or flutter be suspected check the intermediate wheel after first making sure the record is not at fault. Flutter or bump in the reproduction may be caused by flats on the intermediate wheel. These may result from the turntable being held stationary with the motor switched on, for this reason the turntable must never be stopped with the hand, but the unit switched off by means of the on-off switch on the unit plate. Should the intermediate wheel become damaged it should be replaced with a new one.

Flutter and wow can also be caused by the side face of the rubber tyre on the intermediate wheel rubbing on the side of one of the motor pulley steps, the position of the pulley on the motor shaft should be such that there is $\frac{1}{32}$ " clearance between the side faces of the intermediate wheel and motor pulley steps. Wow can be caused by oil or grease on the motor pulley, intermediate wheel tyre or the driving surface of the turntable. In this case thoroughly clean all driving surfaces with a clean rag.

Should hum, originating from the motor, be suspected, see that the motor is freely suspended on its springs and that the motor transit fixing screws Diagram 5 have been unscrewed. Also see that the power supply and earth leads are slack and not straining the motor on

its springs, these leads, if too rigid, will transmit the motor vibration to the cabinet and so be reproduced.

Should the motor fail to start on switching on, first make sure that the power supply is reaching the terminals in the terminal block. If found to be correct switch off at the power supply then check that the voltage range change over links are tight, also remove the switch cover and check that the switch contact moves each of the two switch blades as it moves between them when switching on. The switch blades and the contact should be thoroughly cleaned and a faint trace of vaseline placed on each of the two blades before replacing the cover.

Should the motor still fail to start check the circuit of the coils. The total resistance should be 460 ohms if set on the 200 to 250 volt range or 115 ohms on the 100 to 130 volt range.

If the turntable continues to revolve for several revolutions after switching off by means of the switch on the unit, the turntable brake pad probably needs adjusting. To make this adjustment, remove the turntable as described on page 12, loosen the turntable brake adjusting screw, Diagram 5, move the brake a small amount outward toward the rim and retighten the screw. Make sure that the brake is not set too far out because it can prevent the switch breaking contact if so set.

Spare Parts List
