Figure 1. General view of ST-6 turntable

Warning: To prevent fire or shock hazard, do not expose this turntable to rain or moisture.

I MECHANICAL CONCEPT

The concept of the ST-6 mechanism is shown in Figure 2. The tone arm is supported in a two-axis gimbal mount. The horizontal axis contains the dashpot – damped stylus elevation mechanism. In the vertical axis the tone arm is supported by a tracking roller that rolls against the tracking shaft. When the tone arm is tangential to the record groove the tracking wheel is biased in angle so that the carriage travels toward the platter center at approximately 0.17 inch per minute. This corresponds to the average velocity of the master disc. As the tone arm attempts to pivot in angle to track pitch variations, the angle of the tracking roller axis changes relative to the cylinder axis. This change in direction of the tracking roller accelerates or decelerates the motion of the carriage to track the pitch of the groove. The correction is continuous, self-adjusting, and automatic.

Figure 2. Tracking and drive schematic

II TROUBLESHOOTING

(Refer to Figures 3, 10, and 11)

Conditions	Possible Cause & Corrective Measures
1. When the arm is cued to the "up" position, the arm does not nestle all the way up into the notch of the restrictor arm.	1. a. Stop bar screw not properly adjusted or loose. Refer to stop bar screw adjustment procedure. b. Gap between threaded lift pin and lift bracket too large. Refer to threaded lift pin adjustment. c. Incorrect position of dashpot stud. Refer to dashpot adjustment.
2. With the arm "up" the carriage assembly does not move freely enough from left to right.	2. a. Insufficient gap between threaded lift pin and lift bracket. Refer to threaded lift pin adjustment. b. Dirt build up under slide tube bushings. Clean slide rod and bushing area with alcohol. c. Stop bar set screw too tight. Refer to stop bar set screw adjustment.
3. When the arm is cued "down", the stylus does not reach the surface of the record.	3. a. Pivot pin on pivot bracket dirty or excess grease. Clean. b. Stop bar set screw adjusted too far down so that it prevents the roller assembly from allowing the tone arm to drop to the correct position. Refer to stop bar set screw adjustment.
4. When the arm is cued "down", an initial fast drop occurs before the damping action takes place.	4. a. Dashpot adjustment wrong causing a space between the tip of the dashpot plunger and the lift bracket surface. Refer to dashpot adjustment. b. Threaded lift pin adjusted for too much air gap between the lift pin and the lift bracket. Refer to threaded lift pin adjustment. c. Stop bar set screw set incorrectly. Refer to stop bar set screw adjustment.
5. When the arm is cued "down", no damping takes place at all. Arm drops hard and quickly to the record surface.	5. a. Defective dashpot. Replace dashpot. b. Dashpot set all the way up to the full height of the mounting stud. Refer to dashpot adjustment.
6. Extreme drift of tone arm as it comes down on the record.	6. a. ST6 not on a level surface. b. Uneven tip on stop bar set screw. Replace screw or use emery cloth to make tip of screw smooth. c. Uneven surface on top of roller assembly rear flat surface. Make surface smooth by using very fine emery cloth. d. Binding in pivot bracket assembly at bearing points. Lubricate nylon bearing with molykote 33 or equivalent. e. Slide tube flat surface not correctly positioned inside roller assembly. Remove top cap of roller assembly and observe that flat portion of the slide tube is vertical facing the front of the unit. To reposition, remove the 2 rear screws holding the stop bar; loosen the 2 set screws, and rotate the slide tube to the proper position. Retighten the set screws. Reassemble the stop bar.
7. As arm tracks across record, arm starts to "lead" the carriage.	7. a. Mis-adjustment of tracking screw/handle. Turn handle clockwise in very small increments until proper tracking occurs. Recheck for proper tracking. b. Mis-adjustment of carriage guide. See carriage guide alignment. c. Threaded lift pin adjusted with no air gap between the lift pin and the lift bracket. See threaded lift pin adjustment.

8. As arm tracks across record, arm starts to "lag" behind carriage.
 8. a. Mis-adjustment of tracking screw/handle. Turn handle counter-clockwise in very small increments until proper tracking occurs. Recheck for proper tracking.
 8. b. Tracking roller Spring (113) broken or one end disconnected.
9. Arm lifts and unit returns to "stop" mode before record material has been completely played.
10. Arm gets to end of record but does not switch to "stop" mode.
 9. a. Check tracking-if arm is "leading" the carriage, reset tracking as per step 7a.
 10. a. Check tracking-if arm is "lagging" the carriage; reset tracking as per step 8.
 10. b. Refer to tripping adjustment.
11. Arm gets to end of record and lifts up but the unit does not switch to "stop" mode.
 11. a. Micro-switch incorrectly positioned. Refer to micro-switch adjustment.
 11. b. Micro-switch defective; replace micro-switch.
12. Arm gets to end of record and lifts off record but does not return all the way up into the notch in the restrictor arm.
 12. a. Insufficient tension for the tone arm caused by too large a gap between the threaded lift pin and the lift bracket. Refer to threaded lift pin adjustment.
 12. b. Restrictor arm incorrectly positioned. To replace restrictor arm refer to paragraph IV-8.
 12. c. Stop bar set screw too loose. Refer to stop bar set screw adjustment.
13. Unit tracks poorly and jams tripping gears-particularly after being disassembled for service.
14. Scraping noise heard when platter is running.
 13. "O" ring installed with reversed twist. Install "O" ring so that as the spindle and bearing assembly is turned clockwise, the tracking shaft rotates clockwise as viewed from the tracking gear end.
 14. a. Pulley not properly positioned.
 14. b. Turntable belt twisted. Carefully remove the belt and reinstall properly with the shiny side of the belt out.
 14. c. Motor not properly positioned. Refer to motor alignment.
15. Excessive "Wow and Flutter."
 15. a. Turntable belt twisted, worn or with rough spots. Replace or reposition belt.
 15. b. Motor binding. Replace motor.
 15. c. Tracking shaft binding. Loosen tracking shaft pulley wheel and reposition for more end play.
 15. d. Defective "O" ring. Replace.
 15. f. Turntable bearing contaminated. Clean and relubricate.
 15. e. Nick on tracking shaft pulley. Polish with very fine emery paper.
16. Excessive "rumble."
 16. a. Motor mounts loose, tighten.
 16. b. Defective motor. Replace.
17. Arm intermittently does not return to notch in restrictor arm. Also binding of carriage left to right.
18. Loss of L or R channel.
 17. Slide tube flat area not properly positioned. Refer to step 6e.
 18. a. Defective cartridge.
 18. b. Open (broken) or shorted wires between receptacle on roller assembly and output cables. Check continuity of all 4 wire paths.

19. Hum
20. Hum pick up as hand goes near arm. Static audible as carriage is moved manually from left to right.
21. Unit does not light up.
22. Unit starts but shuts off immediately.
23. Platter wobble.
24. Cueing lever works but arm won't drop.
25. Acoustic feedback.
26. Chattering or scraping as carriage is moved with arm up.
27. Binding or squeaking as carriage is moved with arm up.
28. Unit will not cue up and shut off with certain records.
29. High frequency content of program material sounds excessively brilliant.
19. Broken circuit in ground path. Scrape through anodize on underside of cartridge holder, and check continuity between receptacle shell and chassis. (See note in owners manual on cartridge)
20. Loose knurled nut on tone arm. Tighten by hand as securely as possible.
21.
 - a. Blown fuse.
 - b. Check that AC switch is "on".
 - c. Faulty pilot light assembly; replace.
22.
 - a. Insure clutch has been positioned initially by sliding tone arm carriage to extreme left and returned right.
 - b. Trip pin positioned incorrectly. Refer to micro-switch position adjustment.
23.
 - a. Check for defective platter.
 - b. Check for defective post and hub assembly.
24.
 - a. Improperly balanced arm-no zero balance.
 - b. Extension spring (110) off.
 - c. Insufficient gram weight.
25.
 - a. Check all four feet; four are equally soft.
 - b. Check unit is level.
 - c. Check for close proximity of speaker.
26. Dirt on lift plate; clean.
27. Slide tube set screws (202) too tight. Remove stop bar, to obtain access to set screws. Loosen set screws slightly. Set screws should be firm but should not bind on slide tube.
28. Excessive or insufficient lead out groove area; leadout beyond RIAA standards.
29. Cable capacitance needs to be matched more closely to cartridge. Refer to cable capacitance matching in adjustment section. ST6 cable capacitance is approximately 110 pf. (including tone arm)

III DISASSEMBLY PROCEDURE

To service various portions of the ST6, it may be necessary to partially or fully disassembly the unit. For purposes of explanation, we will identify these as four stages of disassembly. For each adjustment, we will specify which stage or stages of disassembly are required to accomplish the repairs or adjustments.

STAGE 1 – REMOVAL OF PLATTER AND MAIN DRIVE BELT

STAGE 2 – REMOVAL OF TOP PLATE, FRONT

STAGE 3 – REMOVAL OF LEFT HAND COVER AND TOP PANEL, REAR

STAGE 4 – REMOVAL OF SIDE WALL

A WORD OF CAUTION . . . The items described are ALL dress pieces and have been finished to provide a high quality aesthetic appearance.

EXTREME CARE should be taken when removing, storing, or replacing these parts to avoid scratching or damaging their appearance.

STAGE 1 – REMOVE dress disc, spring washer and retainer ring. Remove platter and main drive belt.

STAGE 2 – Remove entire tone arm assembly from carriage, remove two screws holding top front panel in place; remove top front panel.

STAGE 3 – Remove two screws and then left hand cover; remove two panel screws and then rear top panel.

STAGE 4 – Remove six screws from the bottom and then the entire side wall as an assembly.

IV ADJUSTMENTS

Figure 3 shows the ST6 after all four stages of disassembly. The callouts represent location of adjustments that will be referred to in the following paragraphs. It is recommended that you familiarize yourself with the location of these adjustments.

For some adjustments supplementary line drawings are included with the actual procedure, to provide greater clarity.

Adjustments included are:

1. Stop Bar Set Screw
2. Dashpot
3. Threaded Lift Pin
4. Tripping
5. Carriage Guide
6. Microswitch Position
7. Motor Alignment
8. Restrictor Arm
9. Conversion of ST6 Multivoltage Units
10. Cable Capacitance Matching
11. Carriage Assembly Removal.

Figure 3.

Relay	A	Lift Plate	L
Terminal Board TB3	B	Tone Arm	M
Multivoltage Switch (position only)	C	Gram Weight	N
Terminal Board TB4 (position only)	D	Dashpot	O
Tracking Belt	E	Dashpot Locknut	P
Trip Clutch	F	Terminal Board TB1	Q
Trip Actuator	G	Restrictor	R

Counterweight	I	Pilot Light	T
Stop Bar Set Screw	J	Fuse	U
Magnet	K	Terminal Board TB2	V
		Belt Shifter	W
		Motor Alignment Screws	X

1. STOP BAR SET SCREW

A. Reason For Adjustment

To allow the arm to drop sufficiently far down so the preset weighting applies and allows the arm to track. (Refer to Figures 1 and 4.)

B. Pre-Condition for Adjustment

Arm must be installed with cartridges and shims (when required), and be properly adjusted for balancing and tracking force.

C. Required Disassembly

None

D. Method of Adjustment

With the cue lever positioned for the arm to be in the "down" position, the set screw is adjusted to permit the lower surface of the cartridge (next to the stylus) to just reach the top surface of the metal platter (not mat or record).

*WITH TONE ARM CUED DOWN ON RECORD.

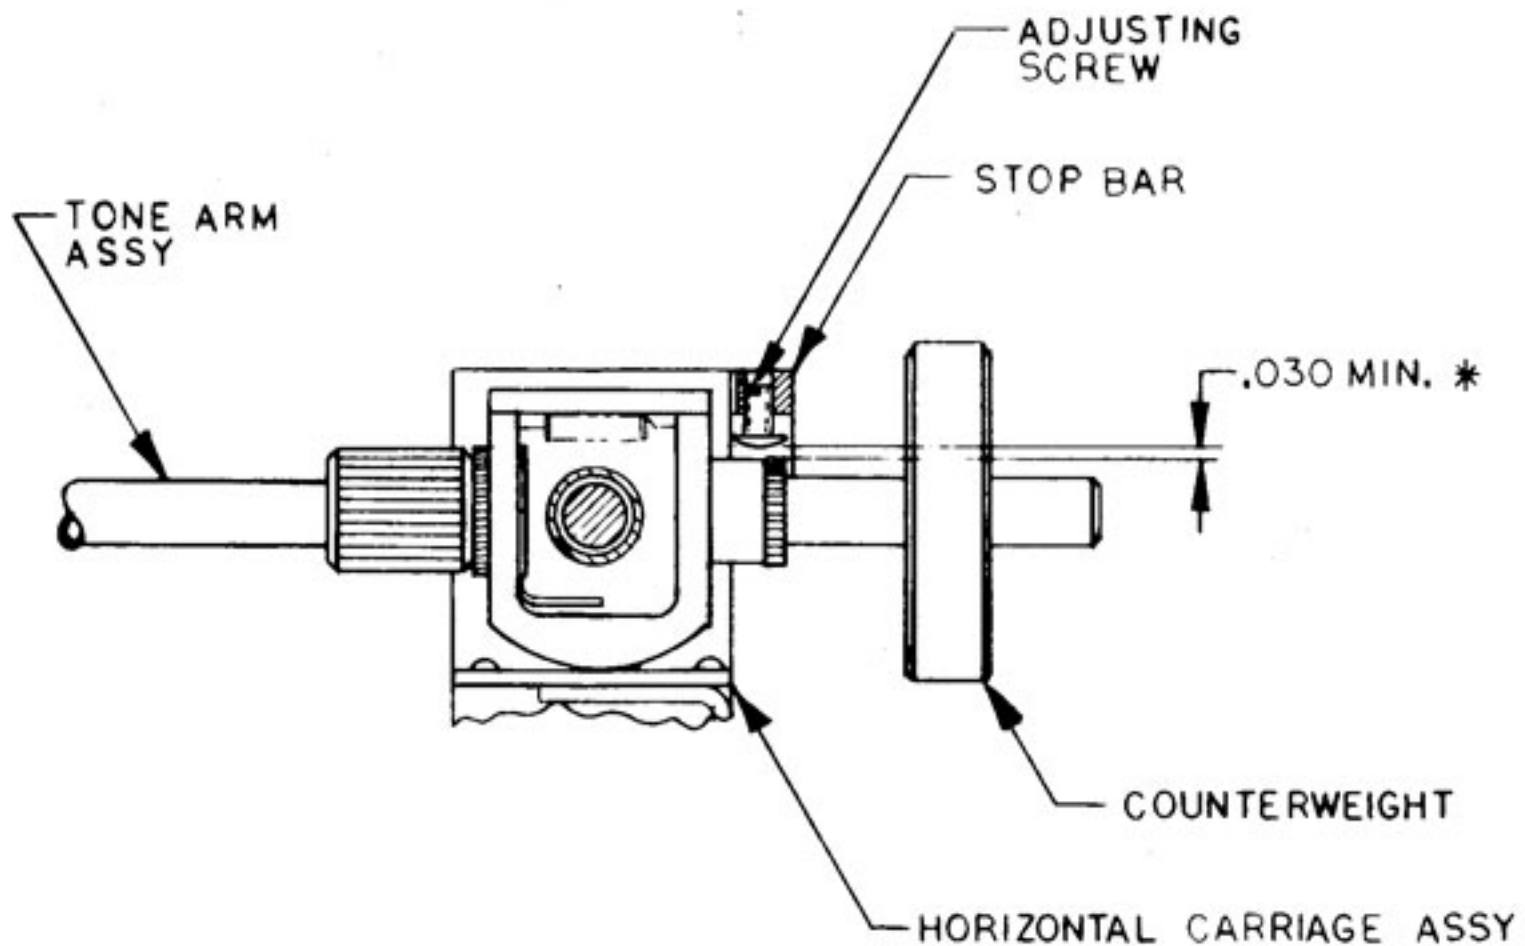

Figure 4. Tone arm cue lift adjustment

2. DASH POT

A. Reason for Adjustment

To permit the arm to lower itself slowly to the record surface when the cue lever is moved downward rapidly. (Refer to Figure 3.)

B. Pre-Condition for Adjustment

None

C. Required Disassembly

Stage 1 and 2

D. Method of Adjustment

With the arm cued to the "up" position, loosen the locking nut on the dash pot stud. Turn the entire dash pot counter-clockwise until there is a large gap between the dash pot plunger and the top surface of the lift plate. Then adjust the dash pot clockwise until the plunger is snug against the lift plate surface. (Refer to Figure 5.) Hold the body of the dash pot and secure the locking nut to hold in place.

* GAP MUST BE MAINTAINED FOR COMPLETE TRAVEL OF CARRIAGE.

Figure 5. Tone arm lift adjustments

3. THREADED LIFT PIN ADJUSTMENT

A. Reason for Adjustment

To allow for a clearance between the lift pin and the lift plate surface, in the arm "down" position, so that tracking will occur as a function of the tracking roller and the tracking wheel touching each other properly. (Refer to Figure 6.)

B. Pre-Condition for Adjustment

The dash pot, stop bar set screw, and the carriage guide adjustments must be properly set before adjusting the lift pin.

C. Required Disassembly

Stages 1 through 4

D. Method of Adjustment

With the arm "down" on the surface of a record, adjust the threaded lift pin with a small 3/16" open end wrench to produce an air gap between the head of the lift pin and the surface of the lift plate. This gap should be approximately .020 inches.

After adjustment, the arm, when cued "up", must cradle properly into the restrictor arm notch and the carriage should move freely from left to right in the arm "up" position. A very tight left to right action would indicate insufficient gap between the lift pin and the lift plate.

The adjustment of the stop bar set screw must be rechecked after setting the lift pin adjustment.

SPECIAL NOTE:

The gap between the lift plate and the lift pin while typically .020 can vary from unit to unit. The gap can be made smaller if necessary to achieve the following:

1. Free lateral movement of carriage in the arm "up" position.
2. Arm must remain cradled in the restrictor notch as the carriage is moved left to right with the arm "up".
3. A gap is visible between the lift pin and lift plate at the extreme ends of the extreme ends of the left and right carriage position with the arm in the "down" position.

Figure 6. Threaded lift pin adjustment

4. TRIPPING ADJUSTMENTS

A. Reason for Adjustment

To ensure that trip function operates properly at the end of a record.

B. Pre-Condition for Adjustment

Tracking adjustments must be complete before attempting to adjust the tripping.

C. Required Disassembly

Stage 3

D. Method of Adjustment

1. Pivot bearing freedom adjustment:
Adjust pivot screw so that trip plate assembly swings freely by itself when mounted on a level surface. Freedom is not to be excessive. Lock jam nut.
2. Adjust stop screw against bracket for nominal $\frac{3}{64}$ gap between trip plate and trip pin when in maximum back position.
3. Adjust clutch spring loading for slipping at 2.2gm/cm. The unit should trip on a commercial record with small run out margin (approx $\frac{3}{8}$ " wide) with tracking force set at 0.75gms minimum.
4. Check tripping on a commercial record with large run out margin (approx 1" wide). Lift off should be smooth. If motion is abrupt, check for dirty stylus, improper tracking force or restriction of trip plate.
5. Readjust stop screw, if necessary, for no trip actuation on a commercial record with a large interband crossover (approx $\frac{1}{16}$ wide) by increasing gap slightly (see para 2). Recheck tripping in small run out margin.
6. Adjust magnet holder so that force to break away trip plate from contact with tripping gear is 0.4 to 0.6 grams, when measured at catch mounting screw. Insure that actuator rod is disengaged from clutch when making the measurement.

NOTE: a) A clean record and stylus in good condition must be used.

b) When checking tripping functions, the stylus should be set down in the preceding band a short distance to allow the tracking to normalize.

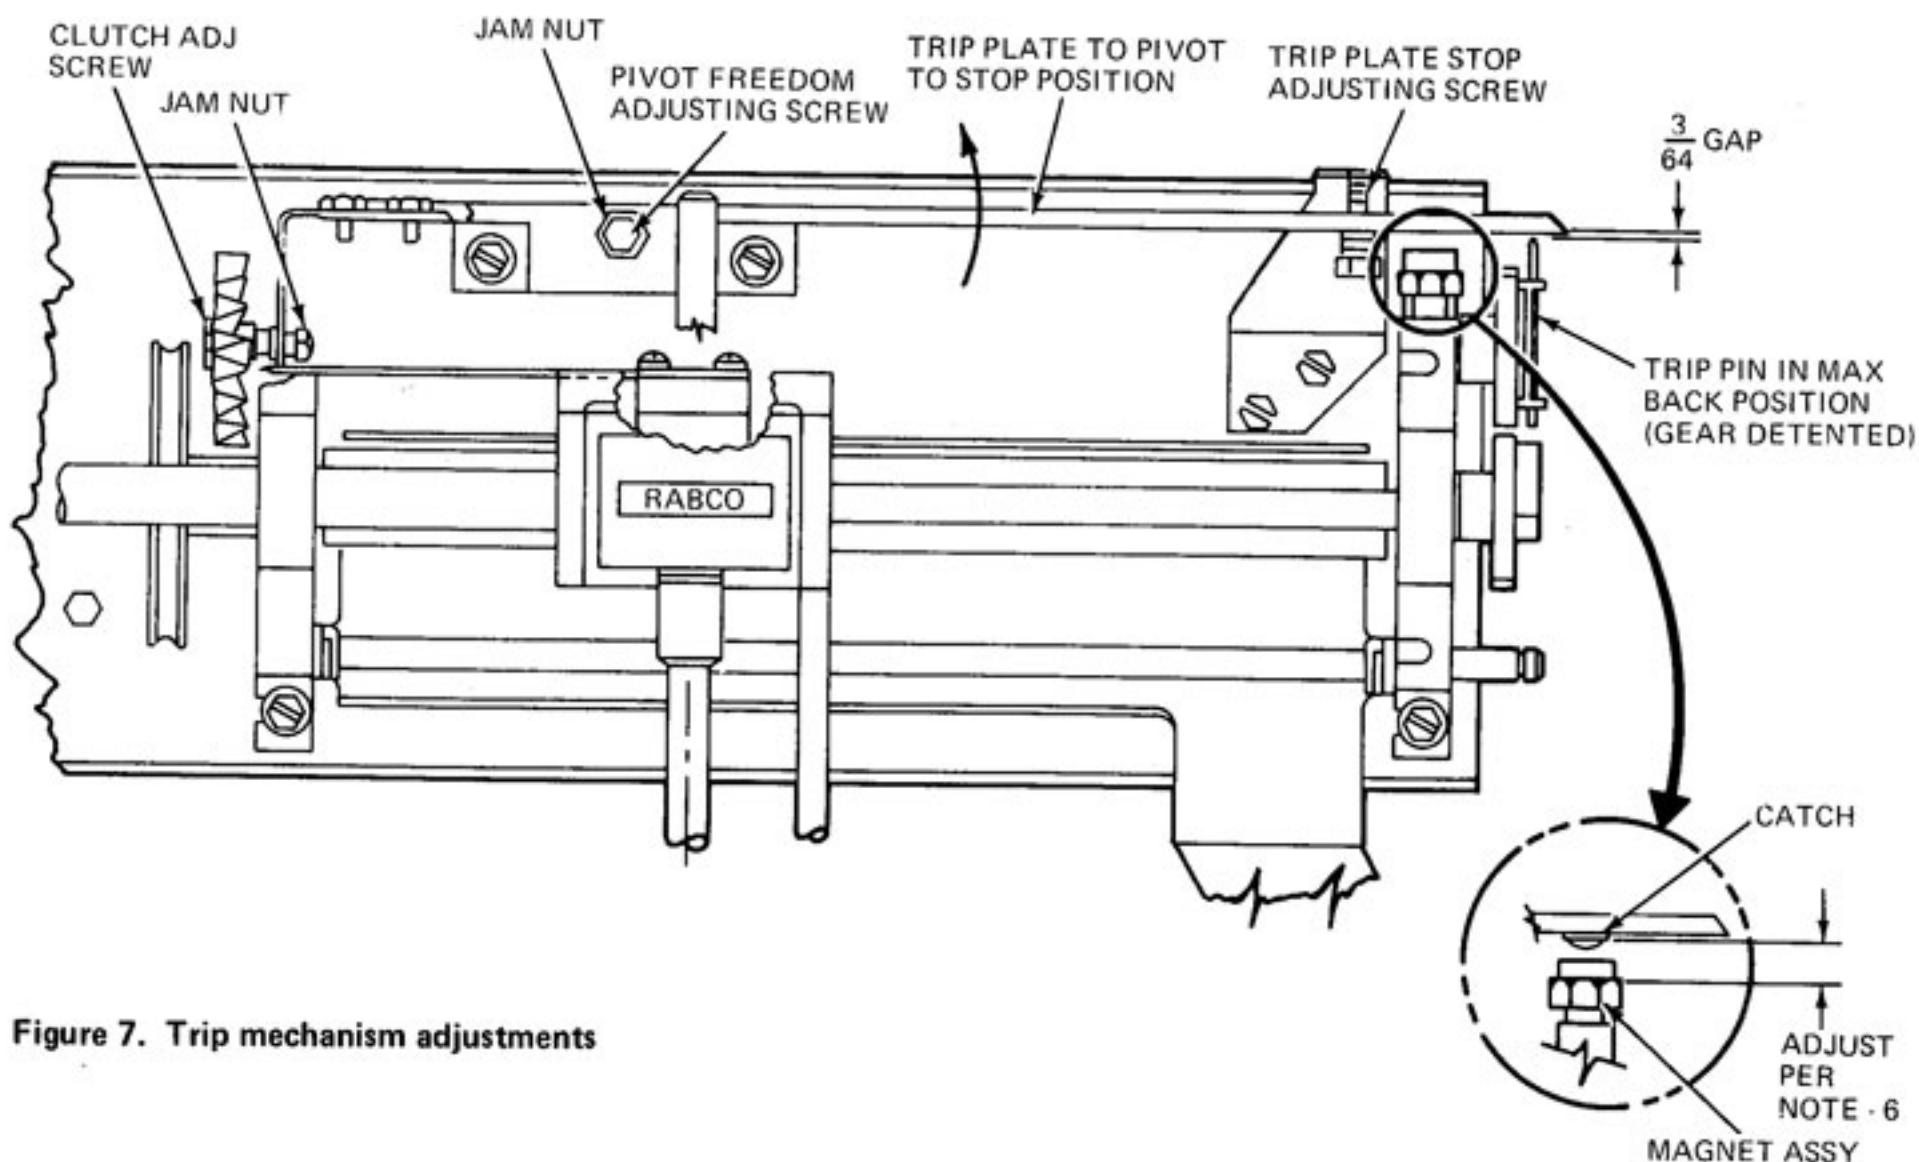

Figure 7. Trip mechanism adjustments

5. CARRIAGE GUIDE

A. Reason for Adjustment

To position the tracking roller directly above the center of the tracking shaft.

B. Pre-Condition for Adjustment

None

C. Required Disassembly

Stages 1, 2, and 3

D. Method of Adjustment

The carriage guide adjustment (Figure 8) must be made so that when the arm is "down," the tracking roller is directly above the center of the tracking shaft. Loosen the outside nut on the carriage guide, and either loosen or tighten the inside nut against the spring tension to position the tracking roller to be exactly centered above the tracking shaft.

Figure 8. Carriage position adjustment

6. MICROSWITCH POSITION ADJUST

The microswitch must be positioned so that when the roller on the lever is engaged in the neutral position of the trip gear, the trip pin going through the gear must be tilted slightly from the horizontal in clockwise direction, but not beyond the tolerance shown. (Refer to Figure 9.)

A. Reason for Adjustment

To position the microswitch for proper operation of the trip gear assembly.

B. Pre-Condition

Remove retaining ring (155) and washer (207) securing-cue lever linkage (11) to trip gear staking assembly, and swing cue lever linkage down for clear access to microswitch.

C. Required Disassembly

Stages 1 through 4

D. Method of Adjustment

Position the microswitch so that the trip pin is slightly off the horizontal as shown in the figure. The switch body should be level. The switch body should be adjusted vertically so the switch clicks on each trip cycle. There should be approximately 1/16 inch clearance between the switch arm and the switch body.

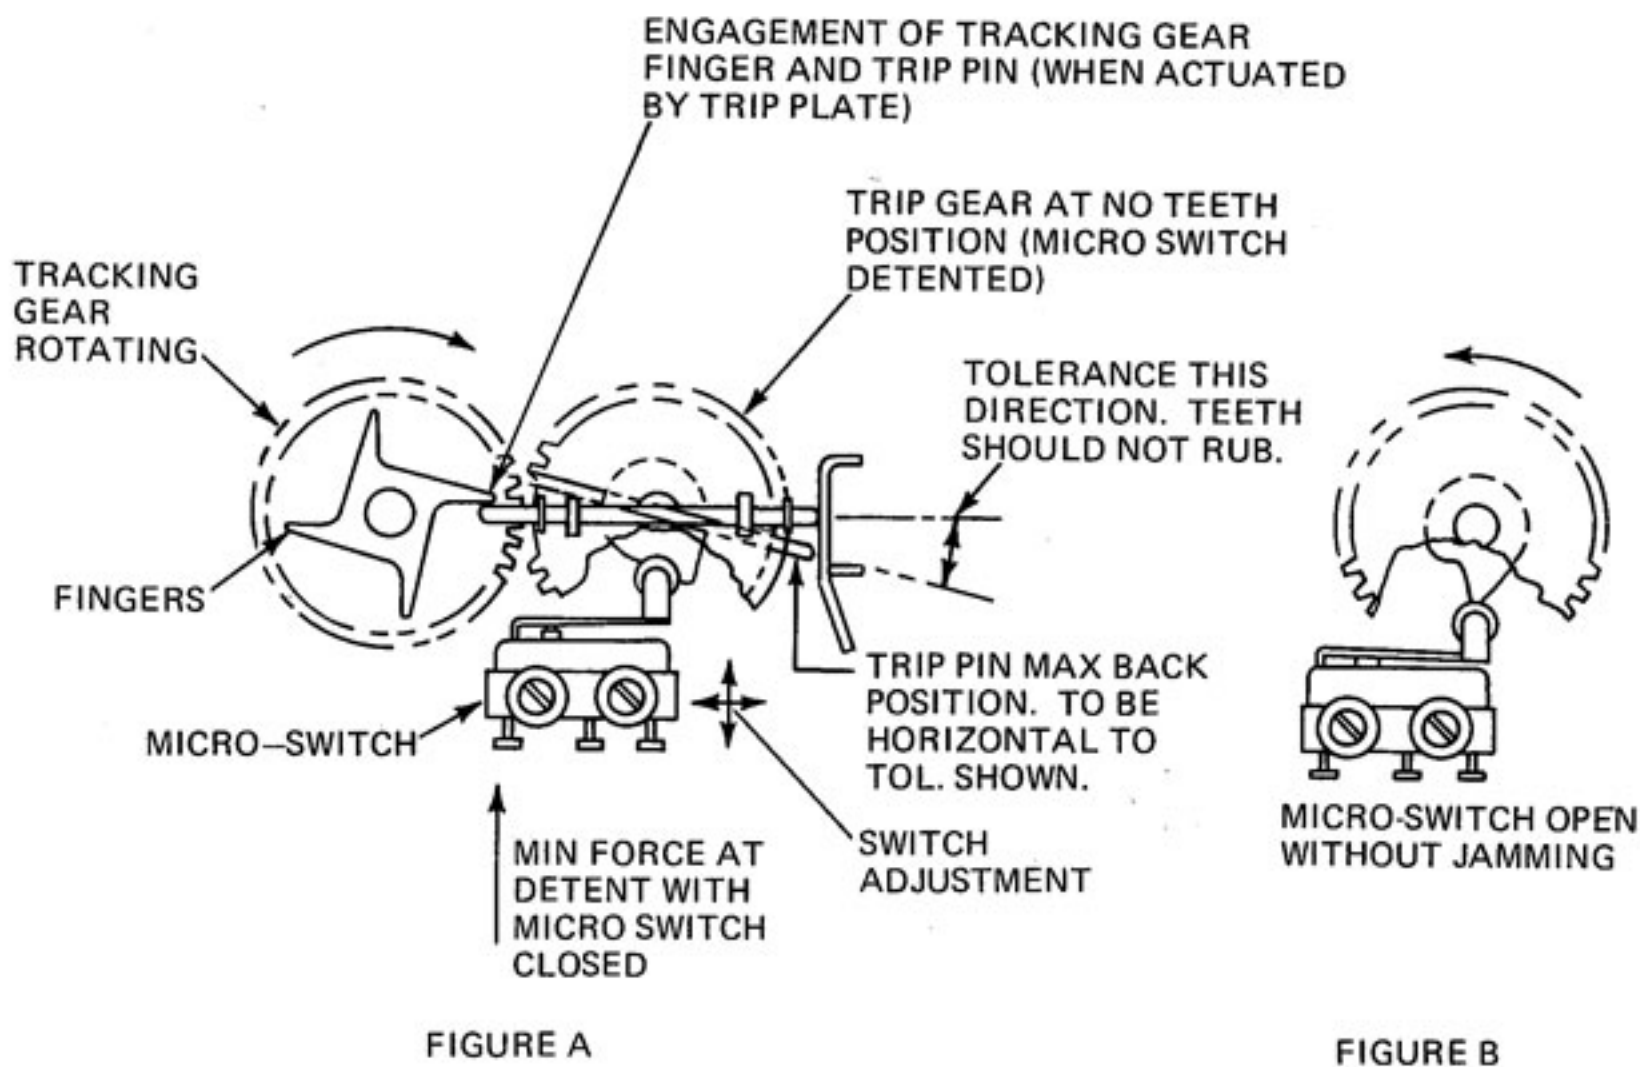

Figure 9. Microswitch adjustment

7. MOTOR ALIGNMENT

A. Reason for Adjustment

To position the motor pulley so it is perfectly parallel with the platter belt surface.

B. Pre-Condition for Adjustment

None

NOTE

A special 7 inch test platter is required to make this adjustment. Test platters are available from Harman Kardon.

C. Disassembly

Stages 1 and 2

D. Method of Adjustment

Set up unit with 7" test platter in place of regular platter. Install belt with shiny side out. Run at 33-1/3 speed and observe belt position on motor pulley. Start with both adjustment screws not touching the motor housing. Turn whichever screw is required to cause the belt to ride exactly in the center of the motor pulley. Turn the second screw to just touch the motor housing but not add any additional tension to the motor. Check belt shifting.

8. RESTRICTOR ARM REPLACEMENT

A. Reason for Adjustment

To allow the tone arm to be recaptured into the notch of the restrictor from any normal angles of record run out grooves.

B. Pre-Condition

None

C. Disassembly

None

D. Method

Loosen the restrictor nut. Position the restrictor arm so that when the tone arm, with cartridge properly shimmed (if required), is placed on the record and moved manually to the extreme left of its pivot; it clears the under side of the arm by approx 1/32".

9. CONVERSION OF ST6 MULTIVOLTAGE UNITS

A. Reason for Adjustment

To convert unit to required voltage and frequency. (Refer to Figure 3).

B. Pre-Condition for Adjustment

Line cord removed from socket.

C. Required Disassembly

Stages 1 and 2

D. Method of Adjustment

1. Locate multivoltage switch (Figure 3) and move lever to desired voltage.
2. Replace pulley with RV (smaller) domestic type.
3. Replace belt with smaller domestic type.
4. Replace the line cord, or select adapter for appropriate wall outlet.

10. CABLE CAPACITANCE MATCHING

A. Reason for Adjustment

To match ST6 cable capacitance as closely as possible to cartridge manufacturer recommendation, if desired.

B. Pre-Condition for Adjustment

Determine cable capacitance recommended by manufacturer.

C. Required Disassembly

Stages 1 and 2

D. Method of Adjustment

Locate Terminal Strip TB1 on Figure 3. The signal cable pairs are terminals 1 and 2, and 5 and 6. The existing cable capacitance for each pair is approximately 110 picofarads. Add the difference in capacitance (manufacturers recommendation less 110 pf) across each pair of terminals (1-2 and 5-6).

11. CARRIAGE ASSEMBLY REMOVAL

A. Reason for Adjustment

To facilitate repair and/or replacement of component parts of carriage assembly.

B. Pre-Conditioning

Remove counterweight and tone arm.

C. Disassembly

Stages 1 through 4

D. Method of Removal

Locate Terminal Strip TB1 on Figure 3. Unsolder five tone arm signal leads (red, green, yellow, white, black). Referring to Figure 10 and 11, locate LH cover (6) and RH cover (7). Remove machine screws (195, 196) fastening covers, and remove both covers. Loosen setscrews (202) on back of LH and RH slide support assys (22) and (49), and remove slide rod (71). Loosen two setscrews (203) on tracking shaft pulley (51) and remove from tracking shaft (72). Remove two machine screws anchoring tracking shaft support (49) to base. Carefully slide carriage assembly off tracking shaft (72).

202	72132185	Screw, Set 4-40x1/4	246	80119579	Nut Hex #8
203	72130713	Screw, Set 4-40x1/8	247	85019242	Washer, Flat #8
204	72131738	Screw, Set 6-32x5/16 Oval Pt	†248	77833890	Screw, 6-32x3/8 M.S. Blk
205	85530267	Washer, Shoulder	†249	85033891	Washer, Flat #6 Blk
206	85030847	Washer, Flat #2 Med.	†250	80633749	Nut, Hex, Keps 6-32 Blk
207	85030244	Washer Flat, Linkage	251	85033947	Washer, Flat
208	85030884	Washer, Flat #3 Med.	252	65030973	Terminal Strip (TB2, 4)
209	85030845	Washer, Flat #4	253	85033761	Washer, Flat
210	85030850	Washer, Flat #6	300	01931745	Side Wall Assy
211	85033946	Washer, Flat	301	01932445	Top Plate Assy (Front)
212	85032082	Thrust Washer	302	01930747	Top Plate Assy (Rear)
213	85030236	Washer, Flat	*303	01832550	Pilot Light Assy (DSI)
214	85019248	Washer, Flat #8	304	01930029	Slide Tube Assy
215	85130848	Lockwasher #2 Split	305	01930035	Mtg Foot Assy
216	85219238	Washer Int. Lock 5/16	306	01930036	Counterweight Assy
217	85231487	Lockwasher Int. Receptacle	307	01930023	Roller Assy
*218	61434037	Belt, Turntable (Export)	308	01931782	Roller & Base Assy
219	85130863	Lockwasher #6 Split	309	01631609	Tone Arm Assy (Only)
220	80619508	Nut, Hex, Keps 6-32	310	01932883	Clutch Screw Assy
221	81932251	Nut, Hex 4-40 (Palnut)	311	01933018	Magnet & Holder Assy

*Recommended Spares

†Not on all models

NOTES-UNLESS OTHERWISE SPECIFIED;

1. NUMBER IN BRACKETS DESIGNATES QUANTITY USED IN THAT ASSEMBLY.
2. --- DESIGNATES MECHANICAL CONNECTION BETWEEN SUB-ASSEMBLIES.
3. NON-SPECIAL ADHESIVES, TAPE, GREASE ETC. ARE NOT DESIGNATED.
- * 4. ITEMS SHOWN ARE NORMALLY INSEPARABLE AND ARE SUPPLIED ASSEMBLED ONLY.
5. LUBRICATION POSITIONS:
 - A GREASE
 - B LIGHT OIL H/K PART NO. 62431701.
6. AREAS MARKED B TO BE KEPT FREE OF GREASE, OIL, DIRT, ETC.
- * 7. ITEMS IN BRACKETS ARE AVAILABLE AS SUB-ASSEMBLIES.
8. WHEN ORDERING PARTS REFER TO MODEL NUMBER, SERIAL NUMBER, PART NUMBER, DESCRIPTION AND QUANTITY.

- NOTES: UNLESS OTHERWISE SPECIFIED;
1. ALL CAPACITORS VALUES IN MICROFARADS $\pm 10\%$.
 2. ALL RESISTOR VALUES IN OHMS $\pm 5\%$, 10W.
 3. S1, S2, S3 ARE MOMENTARY.
 4. CABLE MATCHING CAPACITANCE. SEE ADJUSTMENT 10.
