

MAIN VOLTAGE ADJUSTMENT

When you move to an area where power of a different voltage is supplied, reset the voltage changing switch (100~120V↔200~240V).

Fig. 1

CYCLE ALTERATION

If the supply cycle differs from 50 to 60Hz, or vice versa, replace motor pulley only.

REPLACING STYLUS

Worn out stylus makes noise and sound. Take off worn out stylus and insert new one (A) into (B). Replacement stylus=DT-33H (Diamond stylus life : 1,000~2,000 hours)

Fig. 2

REPLACING CARTRIDGE

The tone arm accepts universal at your choice. To replace the cartridge, remove the head by rotating the connector not counter-clockwise. Replace the desired cartridge, with special care for the correct polarity of wiring. Replacing with the same cartridge requires stylus pressure adjustment for 2.5g. Replacing with the another type cartridge requires balance and stylus pressure adjustments.

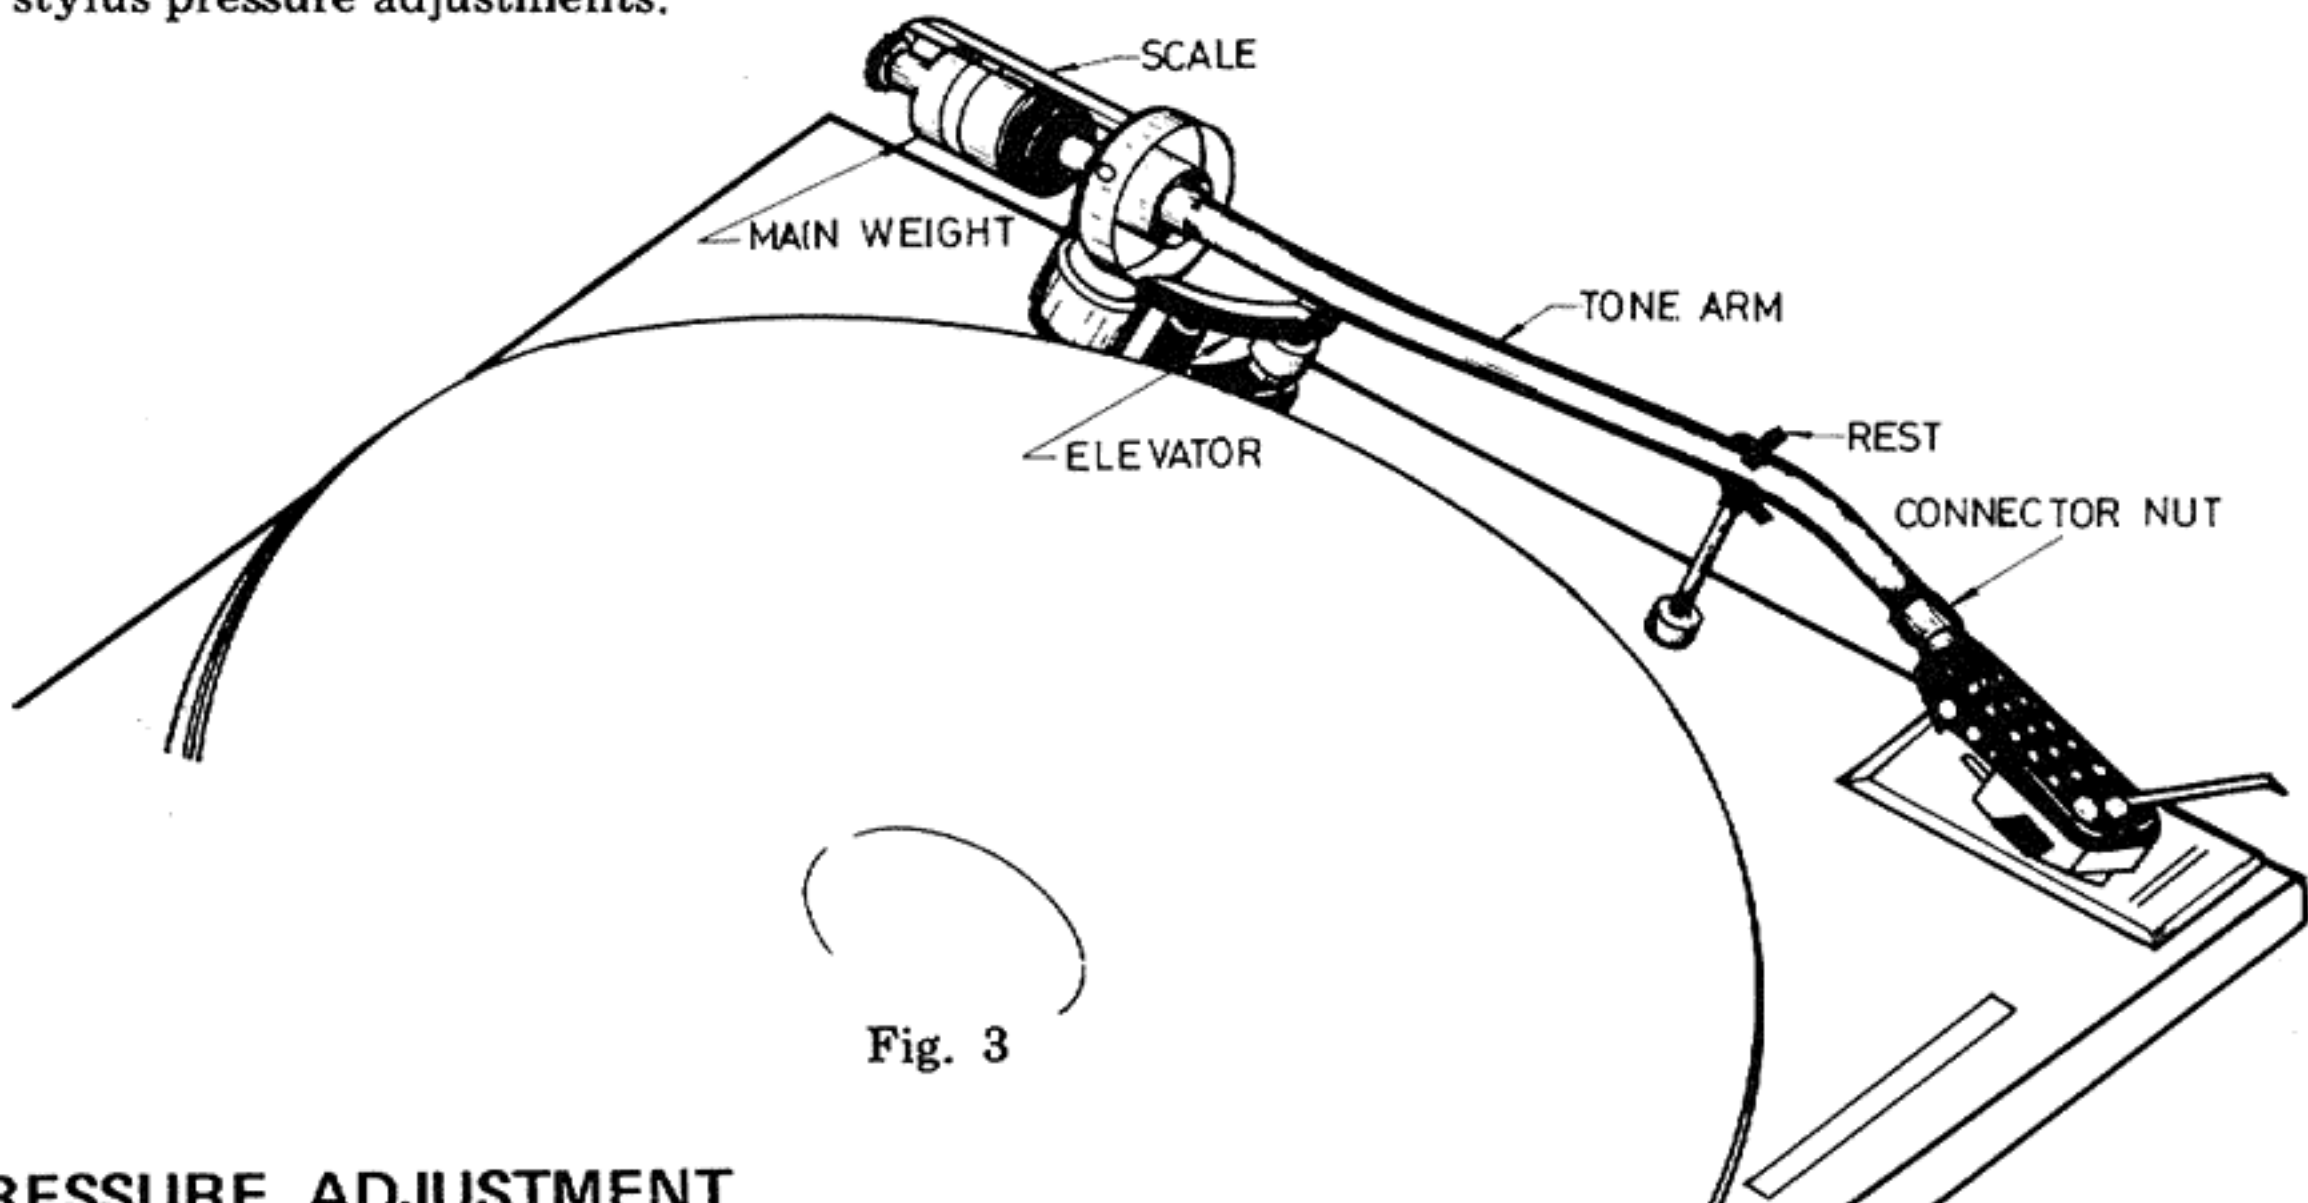

Fig. 3

STYLUS PRESSURE ADJUSTMENT

When replacing the stylus and the cartridge, stylus pressure should be adjusted. Adjust the stylus tip to be on the record level by rotating the main weight (Fig. 4).

To fix the main weight not to turn by hand, rotate the dialing to "O" position. (Fig. 5)

Then, adjust the main weight to required stylus pressure value. (Fig. 6)

(If the require stylus pressure is 3 g, the dial well show as in Fig. 6 when the weight is adjusted.)

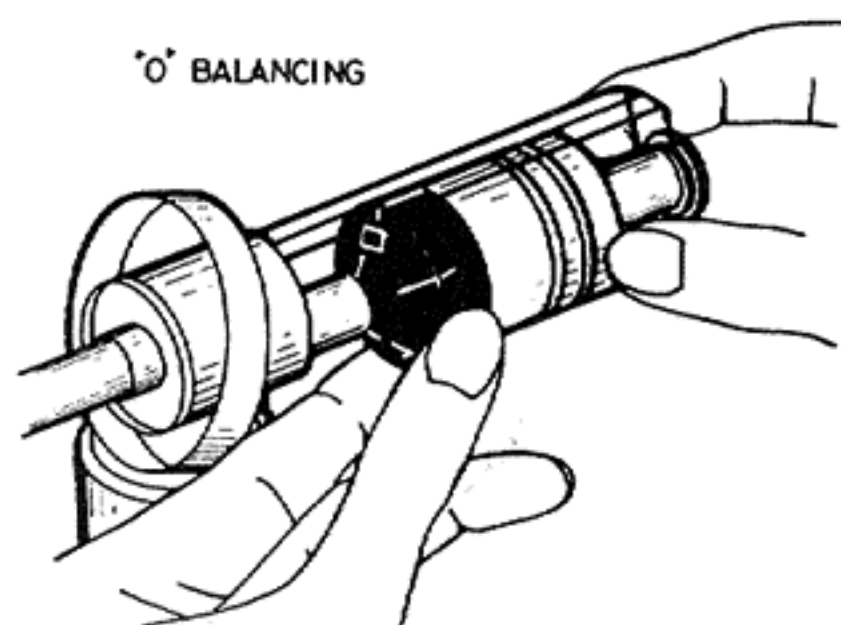

Fig. 5

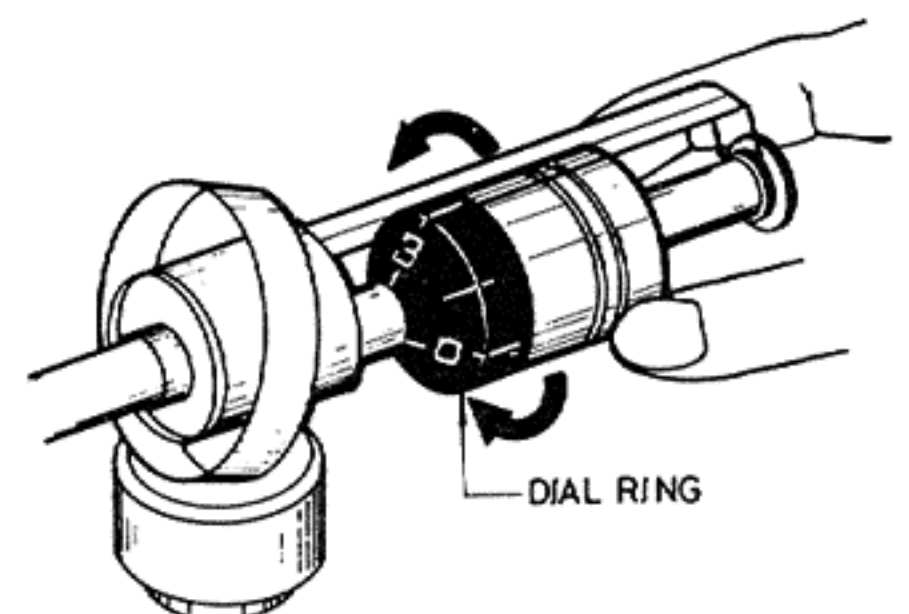

Fig. 6

Auto-Up/Auto-Stop Function

1) At the moment when the disc has been played back to the end, the pick-up goes into the inside turn of the sound groove. At that time the rotating arm pushes the stop plate to push the stopper away from the position shown by the dotted line. (Fig. 7)

The stopper intersects with the turntable pin, so that it is pushed further away by the pin. This causes the gear, which has been locked during the playback, to get free and come into engagement with the turntable gear. The gearing then begins to rotate. (Fig. 8)

2) The slide plate moves in the direction of the arrow along the cam provided under the gearing to lift up the lifting arm. The pick-up rises automatically. (Fig. 9)

3) The rotation of the gearing causes the slide plate and the switching lever to push the contact after the pick-up has fully risen. The motor is automatically switched off (Auto-Stop). The pick-up remains in the upper position; it does not return. (Fig. 10)

4) The stop plate must be in the position shown by the dotted line when the next disc is to be played. To locate it in place, pull the "START" lever, and the gearing will begin to rotate. The stop plate will be moved to the correct position by means of a spring on the gearing. It is ready for the next auto-up function. (Fig. 11)
