CIRCUIT DESCRIPTION

2-3. Test mode

When pin 29 of the microprocessor is pulled LOW (grounded) by connecting it to an outlet (reset), test mode is entered.

(a) All-segments-ON mode

All the segments except those of the graphic equalizer and the ▼2 in figure 1 come on.
When this happens, the graphic equalizer key is inhibited and the SELECTOR key can be operated, but the display remains unchanged. Pressing the Power key once cancels the all-segments-ON mode.

(b) Graphic equalizer test mode

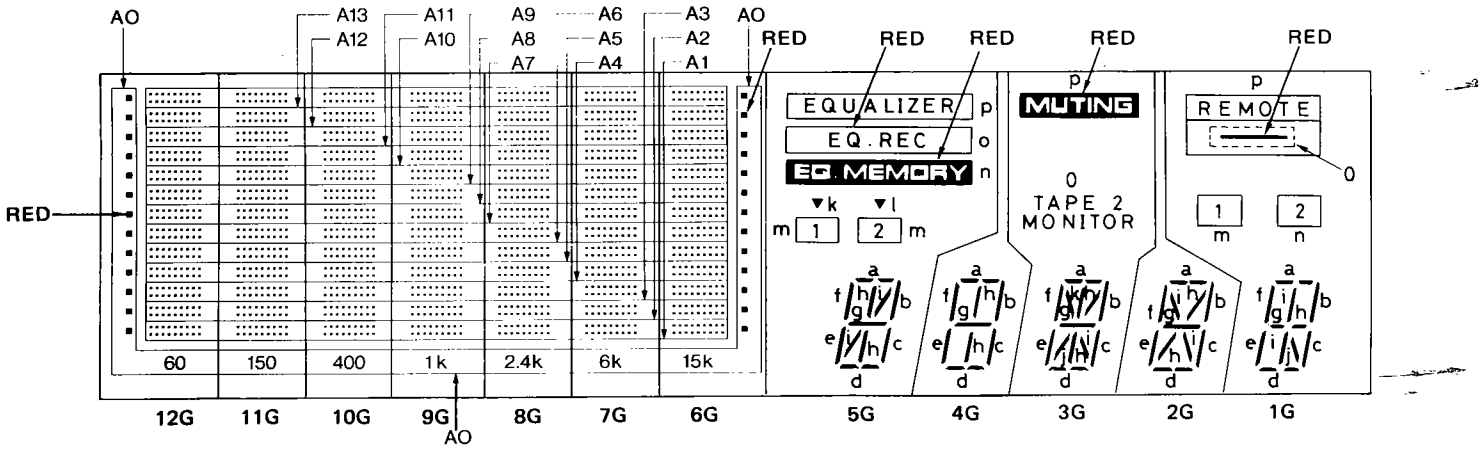
The state of the graphic equalizer can be switched between MAX and MIN by pressing the UP/DOWN key once.

MAX ⇄ FLAT ⇄ MIN

(c) Cancel

Test modes a and b are set to their initial states (SEL, TUNER, and graphic equalizer memory all flat) when pin 29 of the microprocessor is disconnected.

Internal connector (grid and segment layout/color specification) **Fig. 1**



2-4. Protection function

Pin 26 of the microprocessor goes high (5V) to indicate the protection state (abnormal operation).

(a) Protection state setting conditions

The state of the protection IC of the main amplifier is always monitored. When the protection IC enters the protection state, a high signal (5V) is input to the microprocessor. The microprocessor allows about 400ms chaitering time (to prevent malfunction) and then enters the protection state.

(b) Protection indication

"P-OFF" flashes on the character display (selector display) of the fluorescent tube.

(c) Canceling the state

- When in the protection state, all keys except the POWER key are disabled.
- When the protection IC enters the protection state because of a momentary voltage drop or power failure and recovers from it automatically, the protection display automatically returns to the normal selector display.

(d) The microprocessor does not monitor the protection IC state for 5 seconds after the power is switched ON.

2-5. Model Identification (KC-208 [Preamplifier]/ KA-128 [Pre-main amplifier])

- When the signal on pin 25 of the microprocessor is high, the model is identified as a KC-208 (preamplifier). When the signal is low, the model is identified as a KA-128 (Pre-main amplifier).
- Separate program processing is performed when the power is switched ON and OFF.
- Pin 48 (S15) of the KC-208 (preamplifier) controls the FL tube drive power supply (−30V) when the power is switched ON, S15 is pulled high when the display lights.

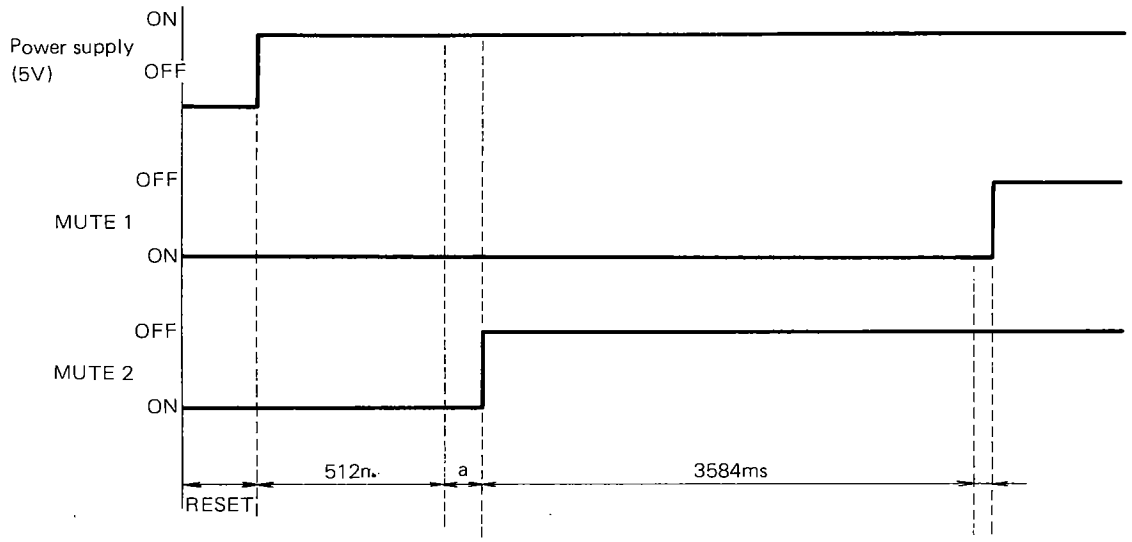
CIRCUIT DESCRIPTION

2-6. Mute timing

PBO (MUTE 1) and PB1 (MUTE 2) are used as MUTE pins. When they are low. MUTE is ON.

Note: PB1 (MUTE2) is used for the preamplifier (KC-208).

•When the power is switched ON (initally, SEL, TUNER).

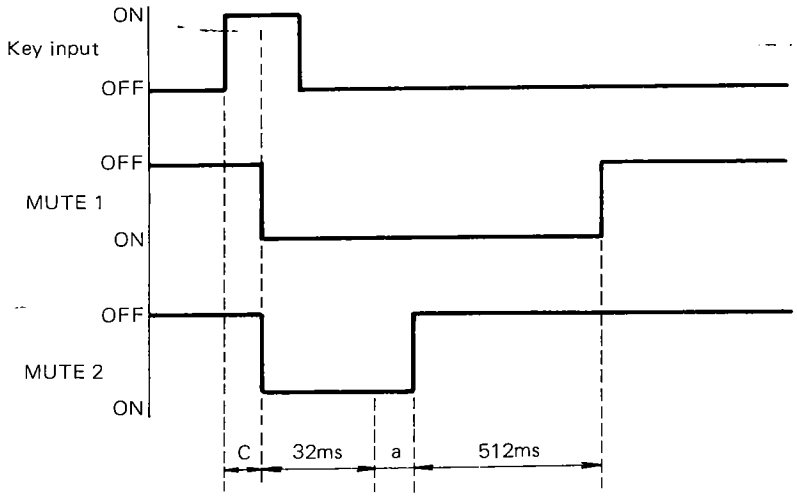


a: Selector IC data transfer (selector switching)
Graphic equalizer IC (7522) data transfer
Graphic equalizer display IC (7565) data transfer.
FL tube selector diaplay data creation.
} about 50 ms

b: Selector IC data transfer (SW ON for the selector state)

Note: When the power is switched ON, the selector IC data is given by "a"; SW ALL OPEN (open all switches) data is transferred.

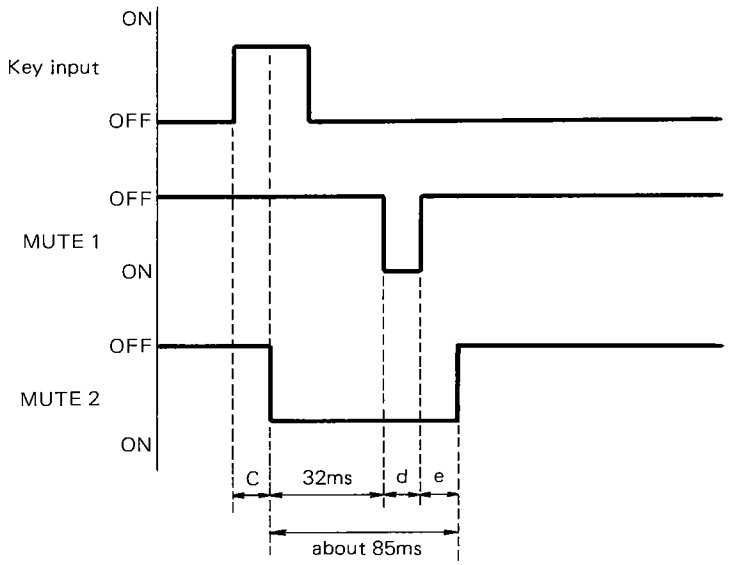
•Selector switching (TAPE 2 OFF)



C: Chattering time (about 20ms).

CIRCUIT DESCRIPTION

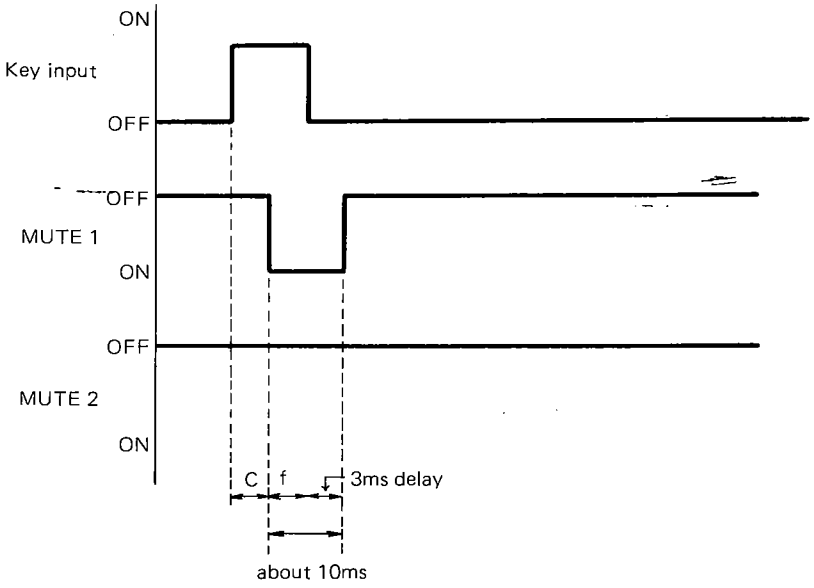
•Selector switching (TAPE 2 ON)



d: Selector switching (about 10ms)

e: Graphic equalizer IC (7522) data transfer Graphic equalizer display IC (7565) data transfer Fluorescent tube selector display

•Selector switching (GE ON/OFF, GE, REC ON/OFF, TAPE 2 ON/OFF)



f: Selector switching

CAUTION: For continued safety, replace safety critical components only with manufacturer's recommended parts (refer to parts list). ⚠Indicates safety-critical components. To reduce the risk of electric shock, leakage-current or resistance measurements shall be carried out (exposed parts are acceptably insulated from the supply circuit) before the appliance is returned to the customer.

- DC voltages are as measured with a high impedance voltmeter with no signal input. Values may vary slightly due to variations between individual instruments or/and units.
- Les tensions c.c. doivent être mesurées avec un voltmètre à haute impédance sans signal d'entrée. Les valeurs peuvent différer légèrement du fait des variations inhérentes aux appareils et aux instruments de mesure individuels.
- Die angegebenen Gleichspannungswerte wurden mit einem hochohmigen. Voltmeter ohne Eingangssignal gemessen. Dabei schwanken die Meßwerte aufgrund von Unterschieden zwischen einzelnen Instrumenten oder Geräten u.U. geringfügig.
