DISASSEMBLY FOR REPAIR

1. CABINET/PANEL

DISASSEMBLY FOR REPAIR

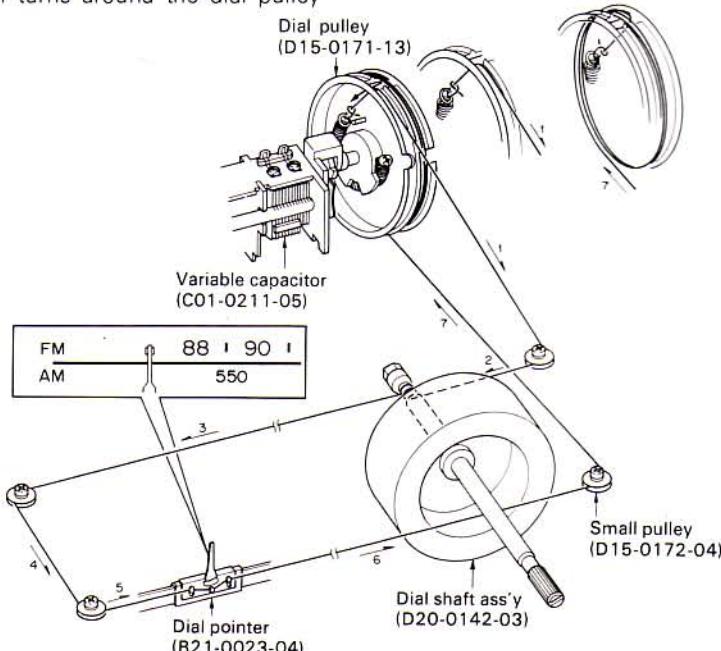

2. LAMP ASS'y

3. DIAL CORD STRINGING

1. Fully close the variable capacitor.
2. Set the dial pulley as illustrated, and fix it with a screw.
3. Tie the end of the dial cord and the dial spring, giving a margin of about 10 cm.
4. Hook the spring on the boss.
5. Dress the dial cord in the direction of "1" to "2", and wind it 2 turns around the dial shaft clockwise.
6. Dress the dial cord in the direction of "3" through "7", and wind it one and half turns around the dial pulley

- starting from its lower side.
7. Tie the dial cord rigidly with the margin cord (about 10 cm, described in 3, above) without permitting any slack.
8. Cut off the unnecessary part of the cord, and release the dial spring from the boss.
9. Mount the dial pointer in position as illustrated. This setting should be checked by receiving a suitable broadcast station actually.

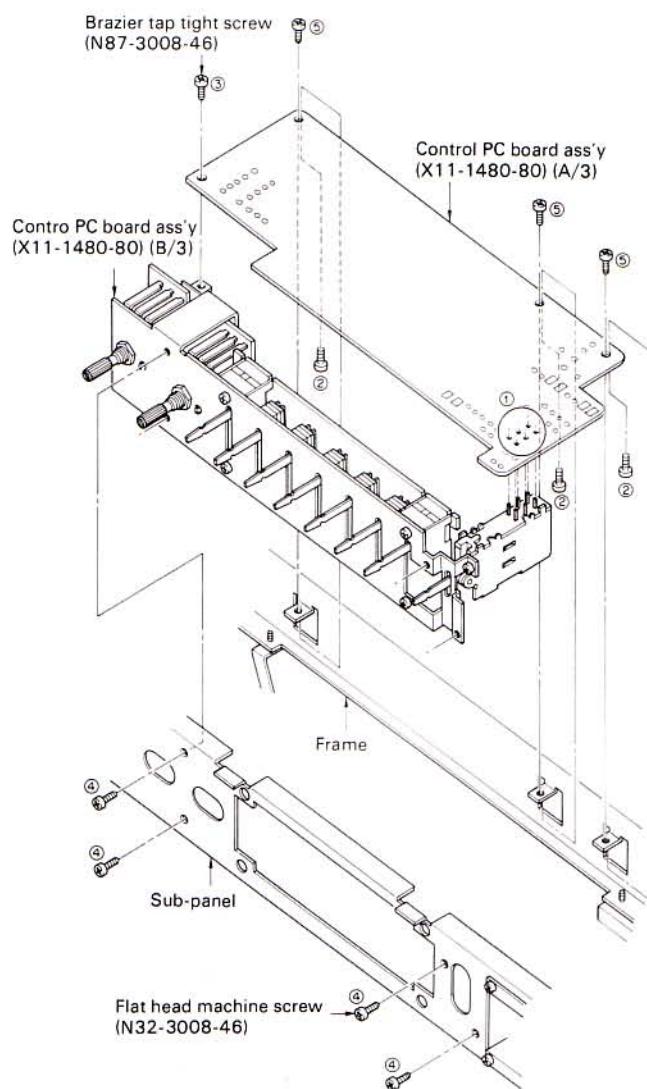

DISASSEMBLY FOR REPAIR

6. TONE AMP

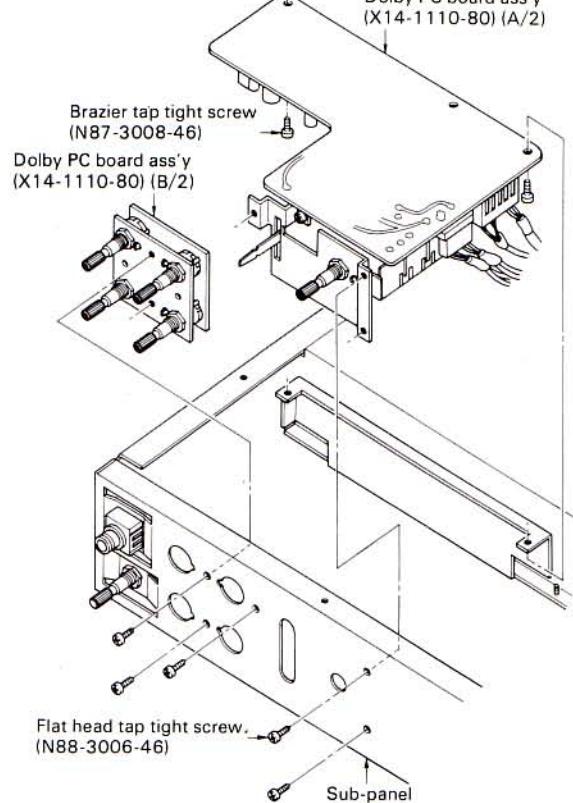

DISASSEMBLING

1. Unsolder.
 2. 3. 4. Remove the screws.
- Then, PC board ass'y can be taken out.
After repairing, fix the screws from the foil side (5).

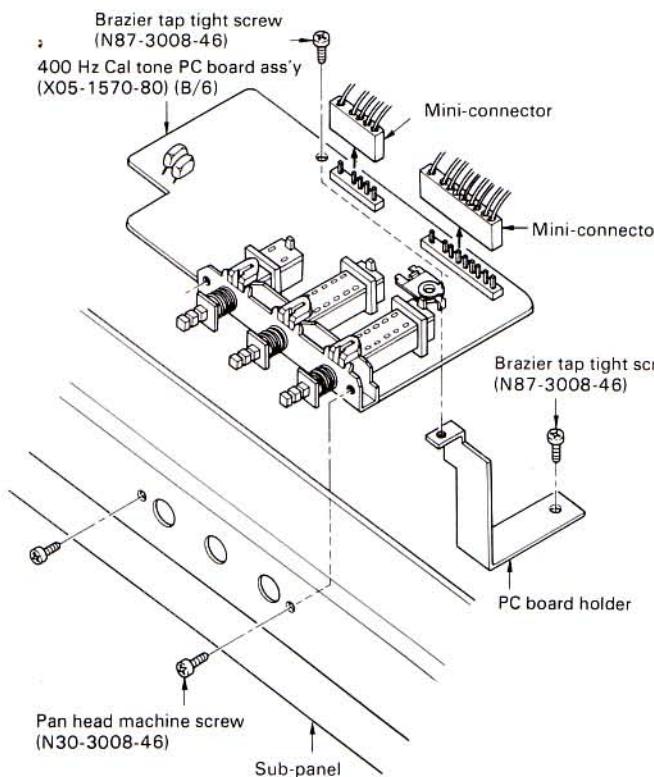

7. DOLBY AMP

DISASSEMBLING

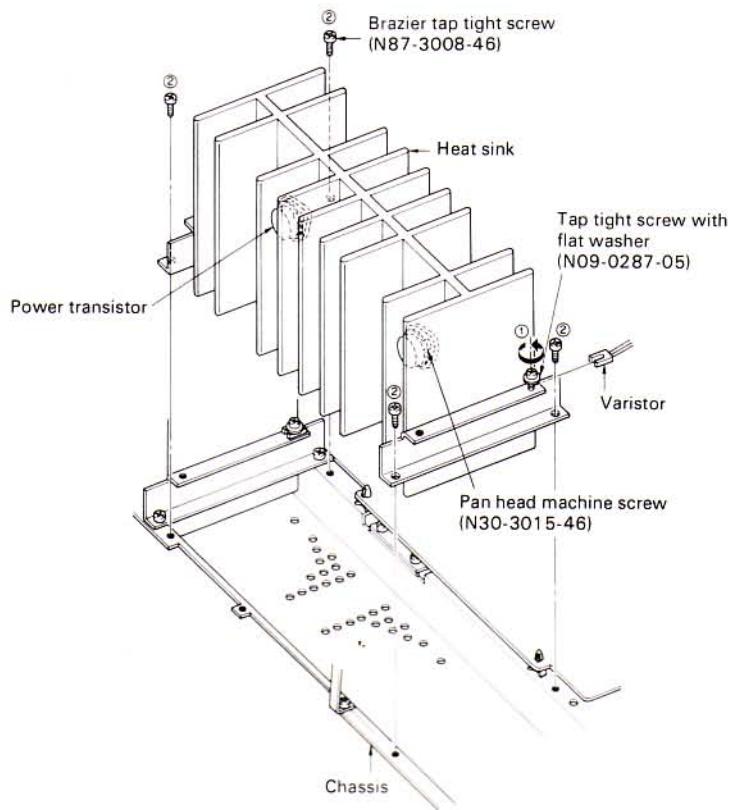

8. 400 Hz TONE

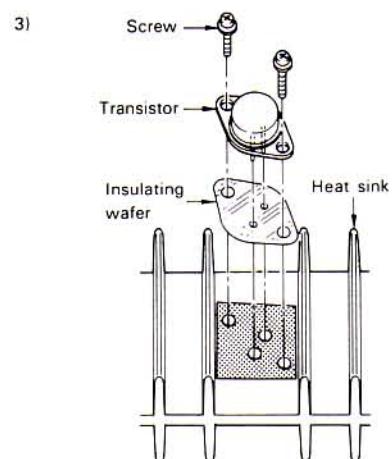

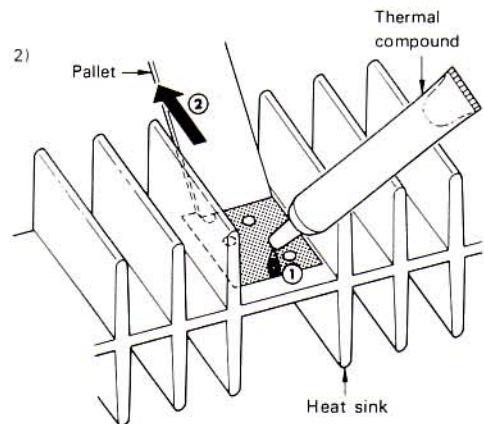

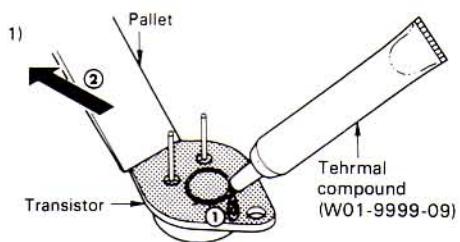

DISASSEMBLY FOR REPAIR

4. HEAT SINK

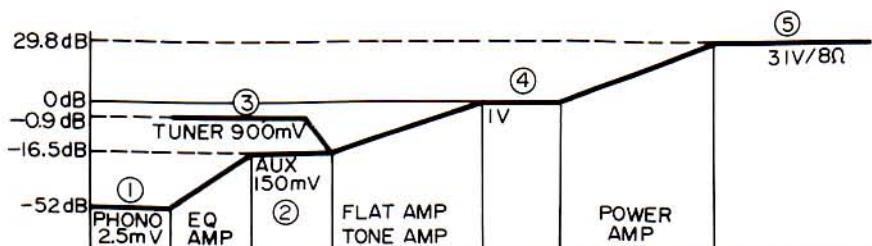

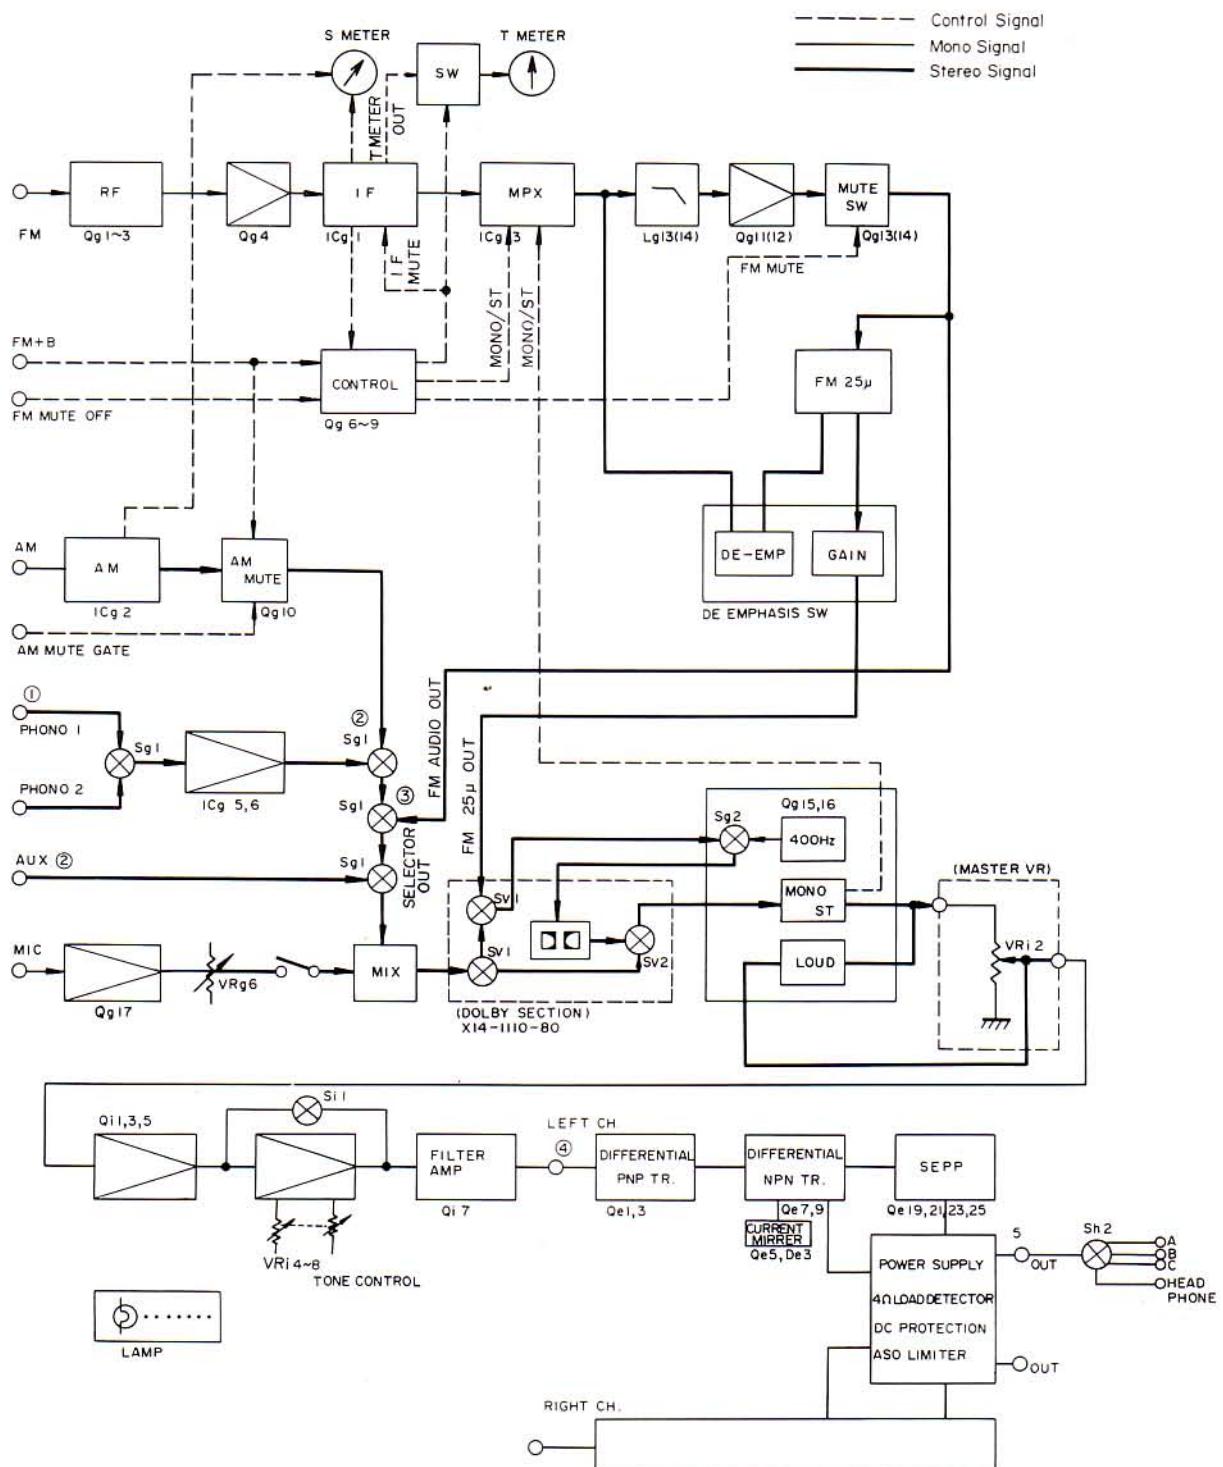

5. POWER TRANSISTOR REPLACEMENT

1. Paint thermal compound on a transistor using a pallet.
2. Paint thermal compound on a heat sink where a transistor is mounted using a pallet.
3. Mount the transistor on the heat sink.

BLOCK DIAGRAM/LEVEL DIAGRAM

CIRCUIT DESCRIPTION

MUTING CIRCUIT

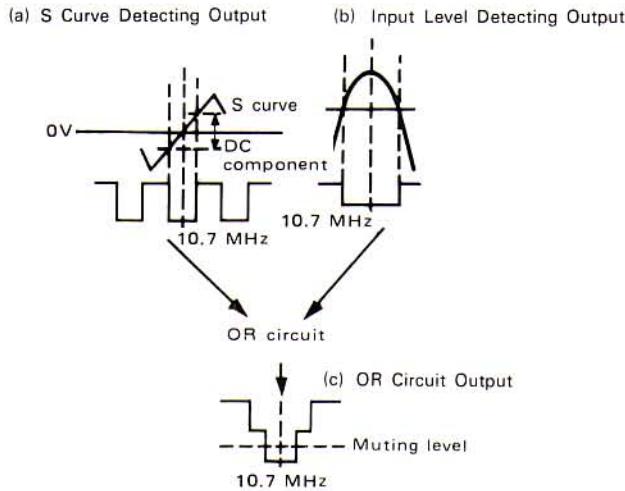

Fig. 1

The HA1137W incorporates the S curve detecting circuit (a) and input level detecting circuit (b). As shown in the figure, the No. 12 pin of the OR circuit (c) provides a muting control voltage which turns Qg6 to ON when antenna input is below 3~20 dB (μ V) of FM signal is detuned. When Qg6 is ON, its collector voltage is low, causing Qg7 base voltage to be decreased which turns Qg7 to OFF. This increases Qg7 collector voltage and thus +B voltage is fed to the No. 11 pin of ICg3 through Dg7. At the same time, Qg8 base voltage is decreased and, hence, Qg8 turns to OFF, changing the quiescent point of Qg9.

When the control voltage is absent, Qg9 collector voltage is about 19V; when it is present, then the collector voltage is about -23V, allowing the gate of Qg13 (Qg14) to be

reversely biased and thus the signal is cut off and FM muting action is effected.

When the muting switch Sh1-3 is set to OFF, Qg9 base is always pulled toward GND, maintaining the positive collector voltage so that Qg13 (Qg14) remains ON.

The circuit consisting of Dg3~5, Cg31, 32 and Rg43 is used to sharply reduce Qg9 collector voltage, when power is turned to off, to prevent the generation of pop-noise.

MAC CIRCUIT

The model employs MAC circuit to compensate for frequencies more complex than those handled by common middle tone controls.

As shown in the figure, this circuit is a series connected 2-stage BAX type tone control, in the 250 Hz circuit the 0.022 μ F capacitor compensates for the frequencies falling from the top to the right and the 0.1 μ F capacitor, the frequencies falling from the top to the left.

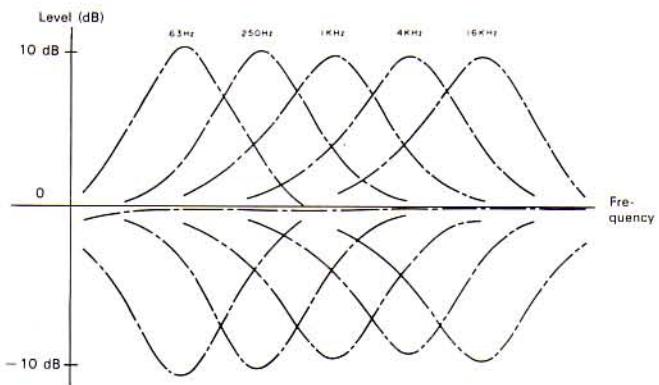

Fig. 3 MAC characteristics

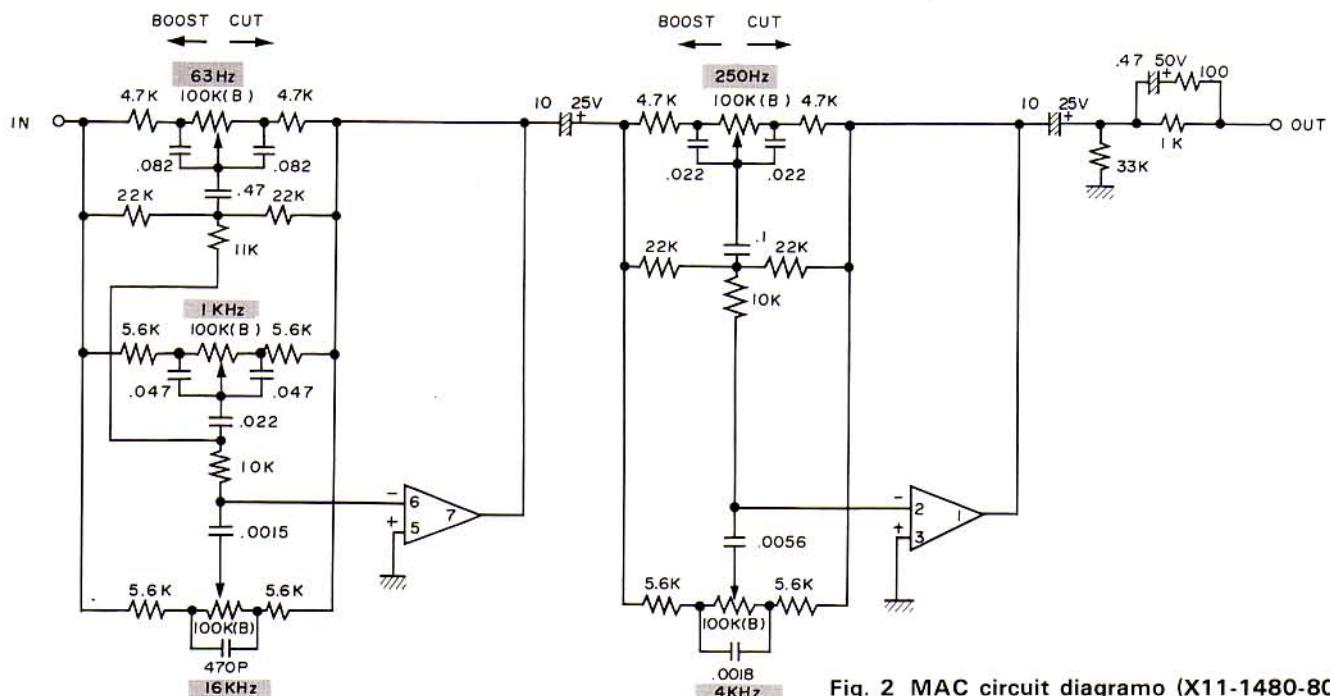

Fig. 2 MAC circuit diagram (X11-1480-80)

CIRCUIT DESCRIPTION

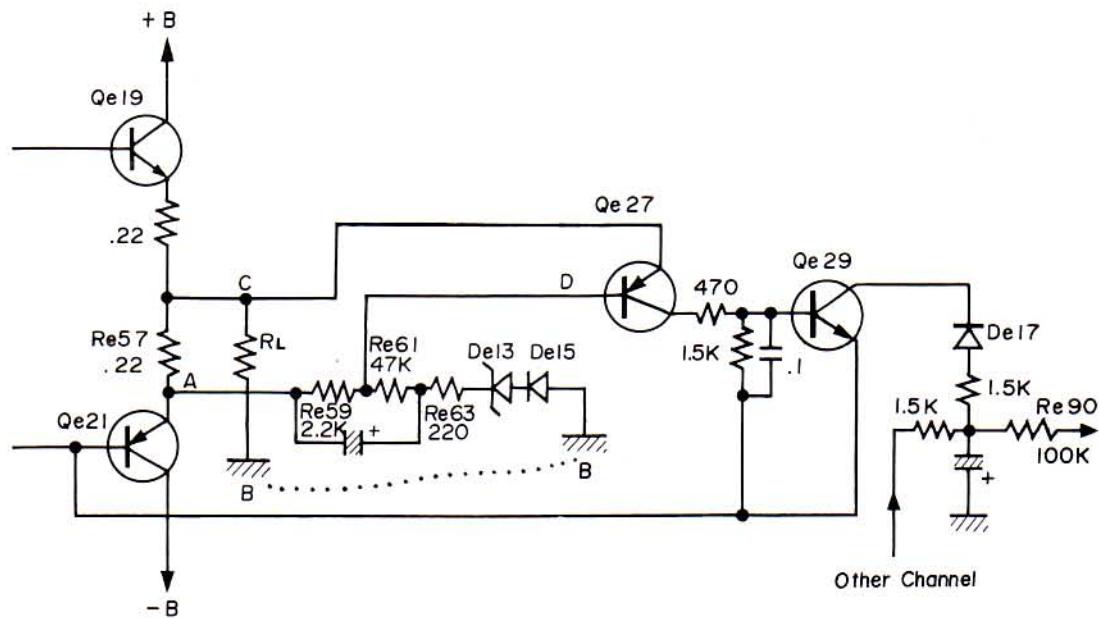

Fig. 4

4-OHM LOAD DETECTOR CIRCUIT

This circuit detects a speaker load larger or smaller than 4.7 ohms. It is composed of a bridge circuit with Re57, Re59, Re61 and RL (speaker impedance).

In the bridge circuit, the impedance of Re63, De13 and De15 with respect to Re61 is small. So it is thinkable that Re61 is connected to GND. The circuit is balanced when RL is 4.7 ohms and thus C and D provides the same voltage when a signal voltage (negative cycle) is applied to between A and B. If RL is less than 4.7 ohms, the voltage at the C point is increased while the voltage at the D point remains unchanged. The voltage across C and D is set to .6V by De13 at that time, so both Qe27 and Qe29 are energized. The detecting voltage is negative rectified by De17 and is fed to the memory circuit through Re90. When RL is larger than 4.7 ohms, Qe27 is not energized since the circuit between C and D is reversely biased.

When there is no detecting input, Qe37 and Qe36 are ON and a gate current flows into the thyristor De24, while +B (65V) is applied to the final transistor.

With a detecting input, it is charged in Ce34 and both Qe37 and Qe36 are turned OFF, thereby the gate current stops and De24 turns OFF, and thus +B (54V) is applied to the final transistor.

In this way, the +B voltage to the final transistor is set to 54V when the load is 4 ohms. This reduces the output to prevent it from exceeding the transistor ASO.

TEST EQUIPMENT and its SPECIFICATIONS

STANDARD SIGNAL GENERATOR (RF-SG)

Ranges:	90 MHz ~ 108 MHz (FM) 500 kHz ~ 1600 kHz (AM)
Modulation frequency:	1 kHz, 400 Hz or external input (input level 2V or less)
Deviation:	0 ~ 75 kHz (FM)
Modulation:	0 ~ 30% (AM)
Output:	100 mV or more
Distortion:	0.5% or less

A

B

SOLID STATE VOLT METER (SSVM)

Ranges:	0.3 mV ~ 300V (full scale)
Frequency response:	5 Hz ~ 500 kHz
Impedance:	1MΩ or more

14. VRel. 2

OSCILLOSCOPE (SCOPE)

Ranges:	DC ~ 10 MHz
Sensitivity:	20 mV/cm
Impedance:	1MΩ or more

DISTORTION METER

Ranges:	0.1% (full scale)
Sensitivity:	100 mV or more

FREQUENCY COUNTER (COUNTER)

Frequency response:	10 Hz ~ 1 MHz
Sensitivity:	50 mV or more
Impedance:	1MΩ or more

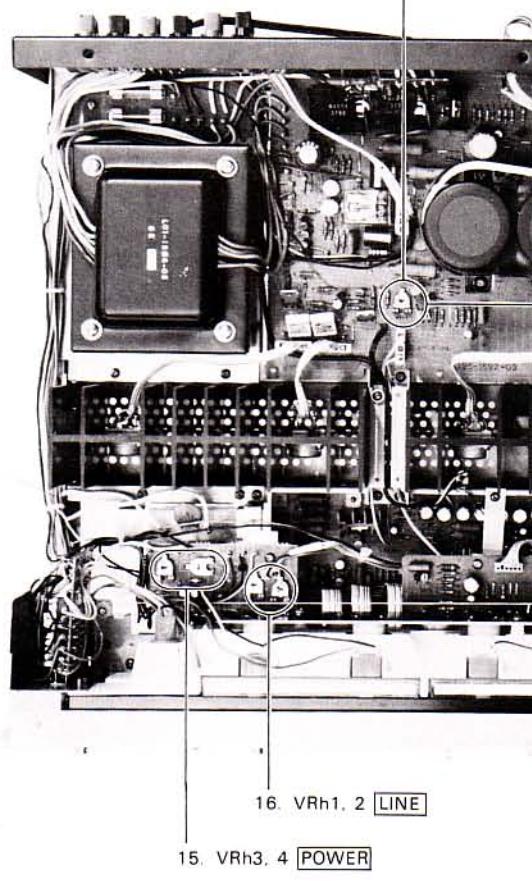

AUDIO SIGNAL GENERATOR (AG)

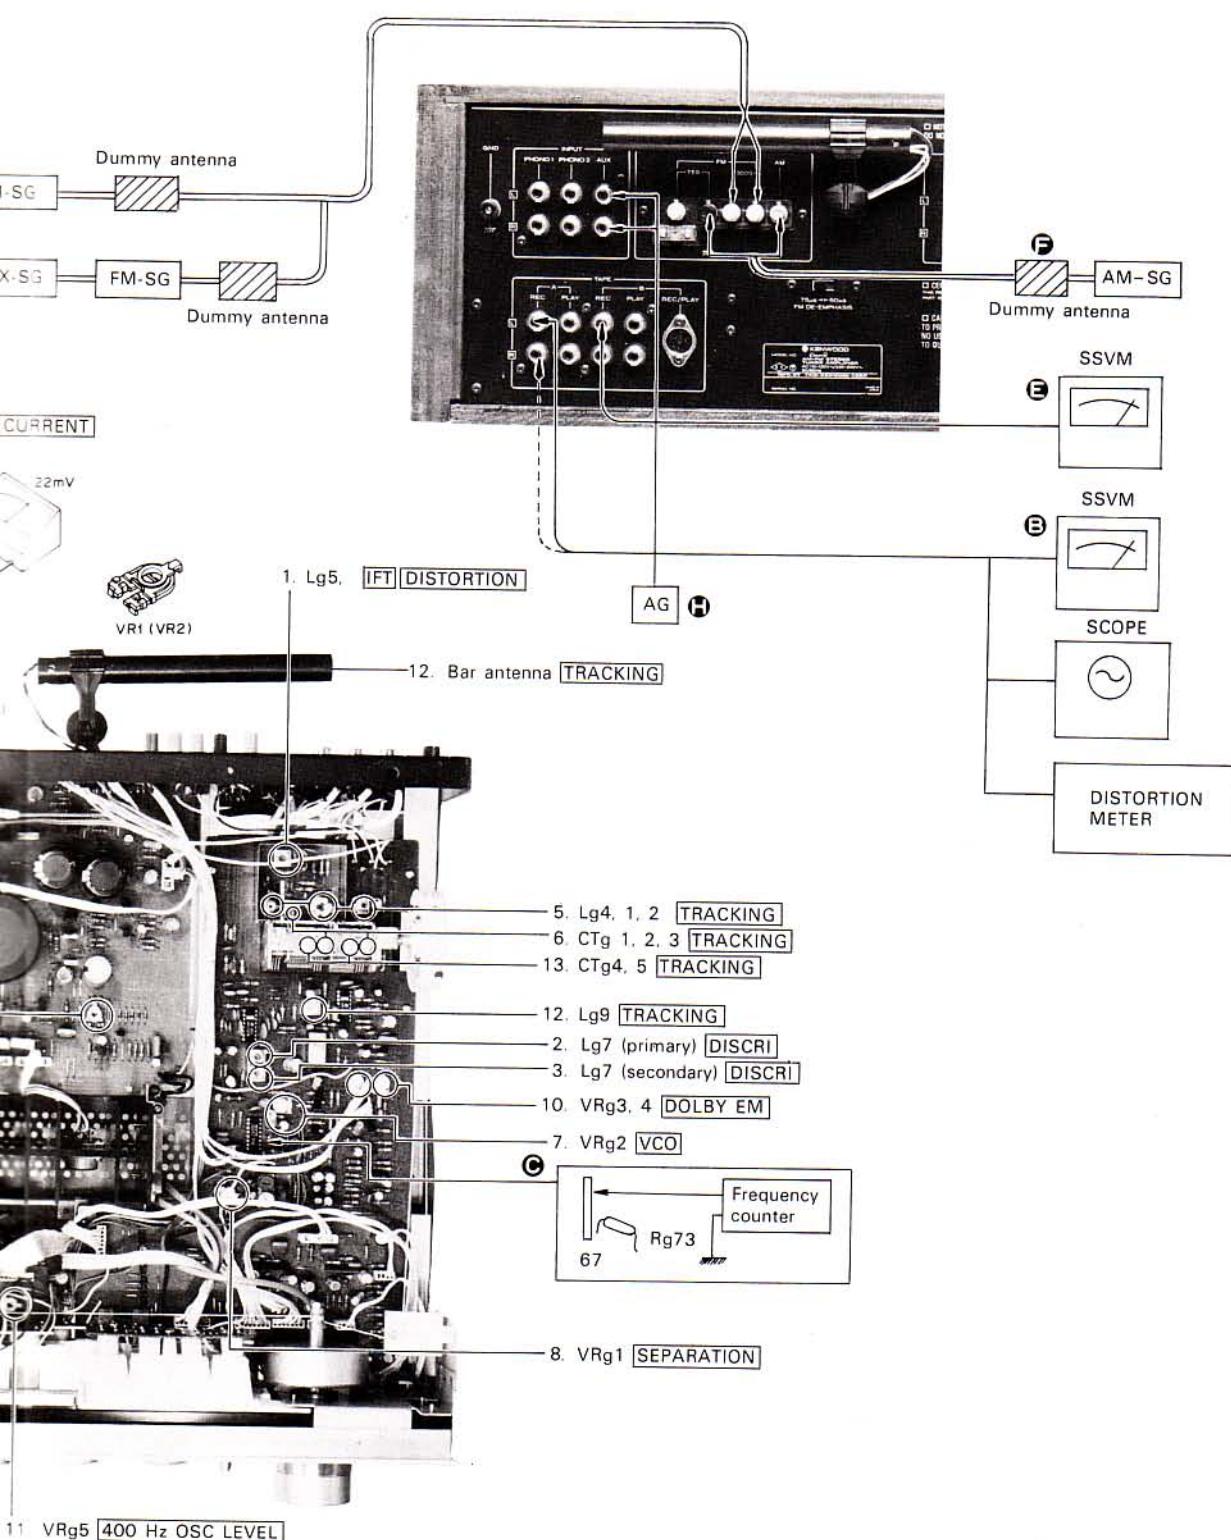

Ranges:	5 Hz ~ 500 kHz
Waveform:	Sine wave
Output:	10V r.m.s.
Distortion:	0.3% or less

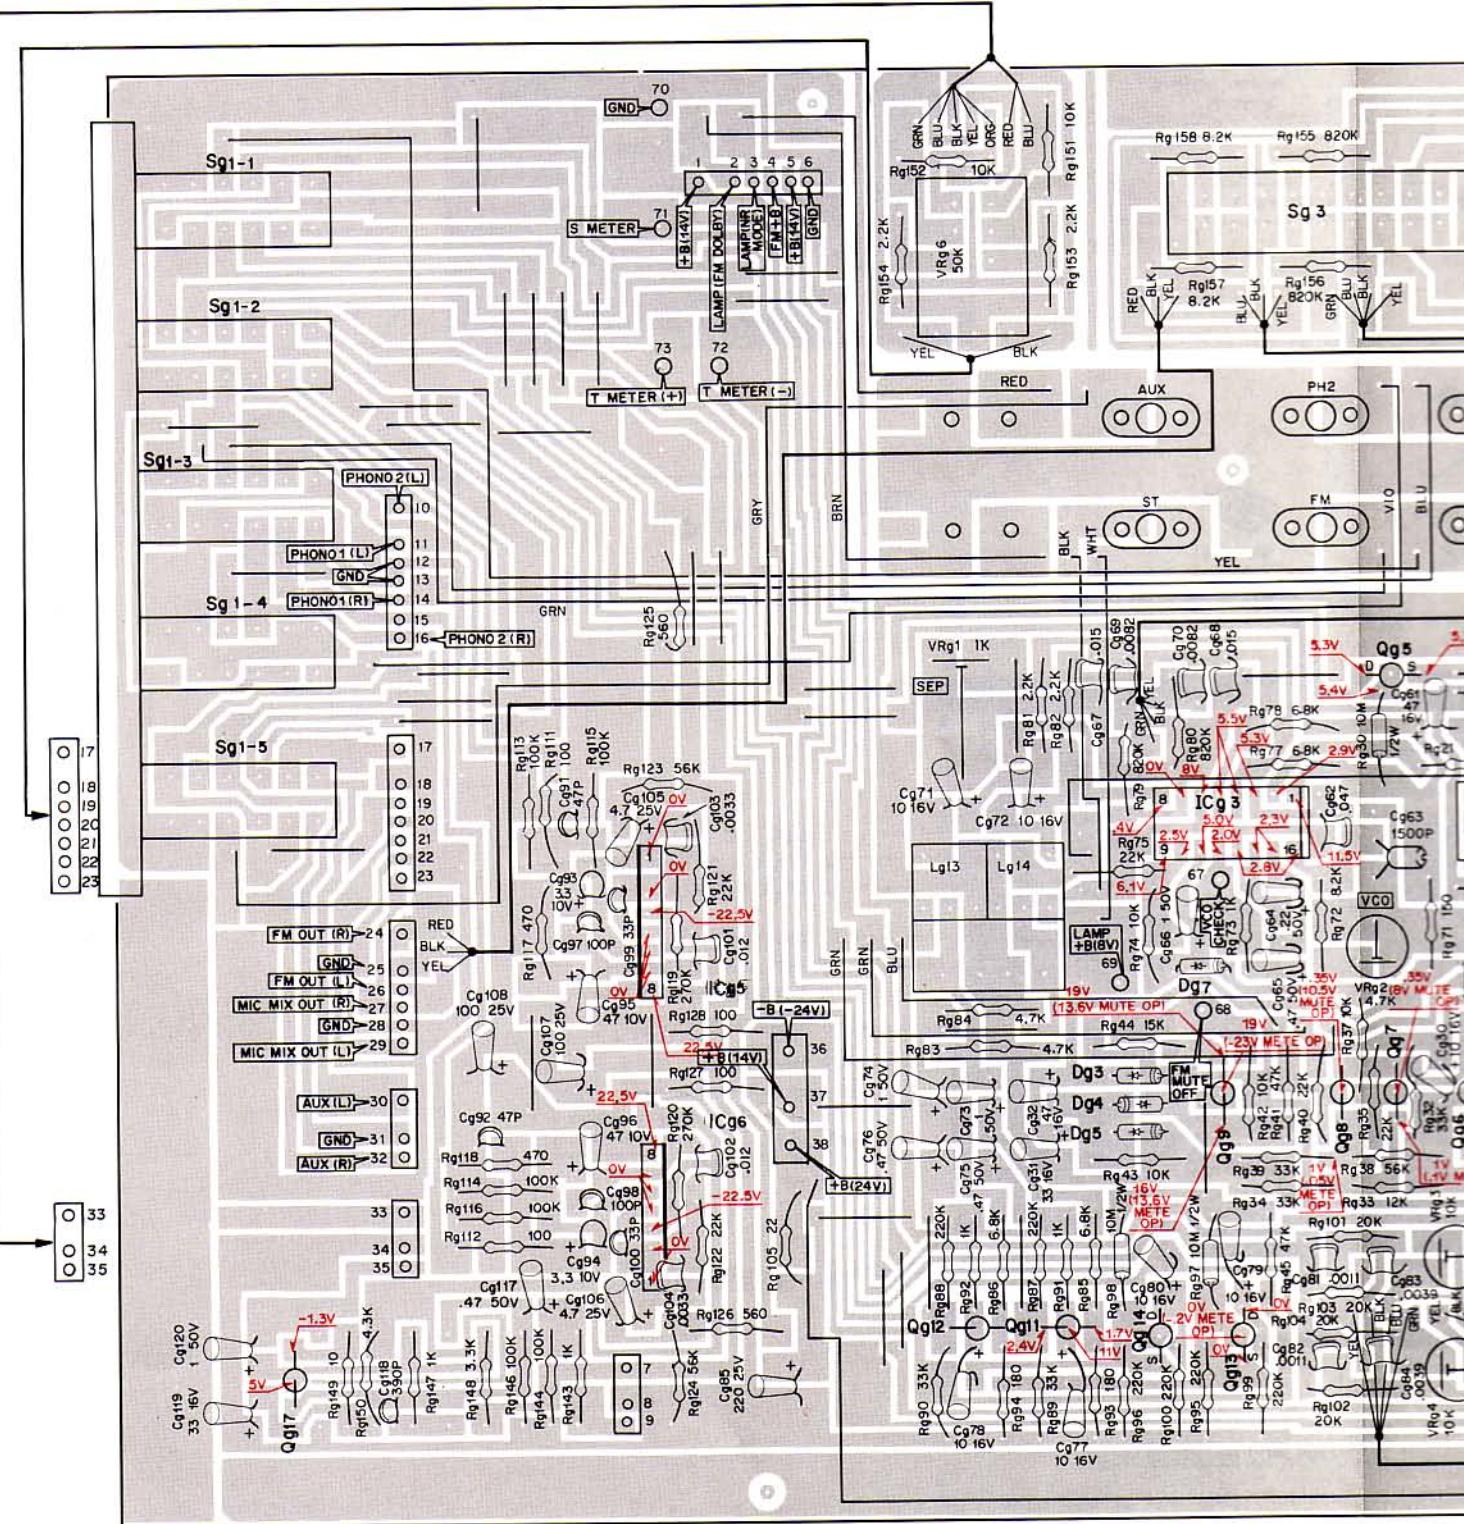

NOTES FOR ADJUSTMENTS

- * Use moderate instrument outputs at all times.
- * The output level of RF-SG means ANT input level.
- * 0 dB = 1 μV
