## INTRODUCTION

This service manual was prepared for use by Authorized Warranty Stations and contains service information for Marantz Model 4140 Solid-State Quadradial Console Amplifier.

Servicing information and voltage data included in this manual are intended for use by the knowledgeable and experienced technician only. All instruction should be read carefully. No attempt should be made to proceed without a good understanding of the operation in the circuits.

The parts list furnish information by which replacement part may be ordered from the Marantz Company. A simple description is included for parts which can usually be obtained through local suppliers.

## 1. SERVICE NOTES

As can be seen from the circuit diagram the chassis of Model 4140 consists of the following units. Each unit mounted on a printed circuit board is described within the square enclosed by a bold dotted line on the circuit diagram.

- |   |                             |
|---|-----------------------------|
| 1. Tape Moni., High Filter Unit .....     | mounted on P.W. Board, P250 |
| 2. Phono Equalizer Amplifier .....        | mounted on P.W. Board, P300 |
| 3. Loudness Unit .....                    | mounted on P.W. Board, P350 |
| 4. Vari-Matrix Unit .....                 | mounted on P.W. Board, P500 |
| 5. Meter Rectifier Unit .....             | mounted on P.W. Board, P550 |
| 6. Temperature Compensation Unit .....    | mounted on P.W. Board, P580 |
| 7. Power Amplifier .....                  | mounted on P.W. Board, P600 |
| 8. Function Indicator Unit .....          | mounted on P.W. Board, P650 |
| 9. Power Supply .....                     | mounted on P.W. Board, P800 |
| 10. AC Rectifier .....                    | mounted on P.W. Board, P850 |
| 11. Balance Variable Resistor Unit .....  | mounted on P.W. Board, P900 |
| 12. Buffer., Pre-Amplifier .....          | mounted on P.W. Board, PE01 |
| 13. Tone Amplifier .....                  | mounted on P.W. Board, PD01 |
| 14. Main-Remote Speaker Switch Unit ..... | mounted on P.W. Board, PL01 |
| 15. Tone Control Unit .....               | mounted on P.W. Board, PJ01 |

## 2. SELECTOR SWITCH

Signals from the PHONO jacks are applied to the phono-amplifiers and equalized to match the RIAA curve for flat frequency response.

The outputs of the phono-amplifiers and signals from the TUNER, CD-4/AUX and TAPE MONITOR IN jacks are led to the SELECTOR switch, S001. The SELECTOR switch selects one set of signals from PHONO, TUNER, CD-4/AUX and TAPE MONITOR IN jacks and sends them to the MONITOR switch and TAPE MONITOR OUT jacks. The selected signals are then applied to the MODE switch, S002.

PHONO and TUNER jacks are for 2-channel input signals, that is stereo signals. CD-4/AUX, TAPE MONITOR IN and TAPE MONITOR OUT jacks are 4-channel, that is quadraphonic signal

## 3. MODE SWITCH

MODE switch S002 has positions of MONO, 2 CH, DISCRETE, VARI-MATRIX and SQ DECODER.

In the MONO position all input signals are mixed together and delivered to all four channels.

In the 2 CH position stereo signals are directly routed to the pair of front left (LF) and front right (RF) channels; the same signals at the LF and RF channels are fed to the rear left (LR) and rear right (RR) channels, respectively. When quadraphonic signals are applied to the input terminals, the LF and LR signals and RF and RR signals are separately added, thus the (LF + LR) signal is delivered to the LF and LR channels and the (RF + RR) signal is delivered to the RF and RR channels.

In the DISCRETE position the quadraphonic input signals are separately routed as 4-channel stereophonic signals to each channel. At this position, for ordinary stereo input signals, neither LR nor RR channels no signal to carry.

In the VARI-MATRIX position, 2-channel stereo input signals are converted into quadraphonic signals through the vari-matrix circuit; the input right and left channel signals are fed directly to the LF and RF channels, while the signals to the LR and RR channels are synthesized from the 2-channel input signals under the control of the DIMENSION control.

The LR and RR channel signal components are controlled by the DIMENSION control as shown below.

DIMENSION control setting	LR output	RR output
Bottom	LF + RF	RF + LF
Center	LF	RF
Top	LF - RF	RF - LF

When the DIMENSION control is set at the bottom the LR and RR channel signals become manaural, at the center are stereophonic, and at the top are out of phase, thus providing vanished sound image positioning.

In the SQ DECODER position, "compatible stereo-quadraphonic (SQ) record" developed by CBS is ideally decoded into 4-channel signals. This requires incorporation of the adapter, Model SQA-1, into the set.

When the MONITOR switch is set to the ON position, signals from the TAPE MONITOR OUT terminals are in discrete mode regardless of the MODE switch setting. In the OFF position, the signals are processed into the mode indicated by the MODE switch in the MONO, 2 CH, or DISCRETE position of the MODE switch, while signals remain in discrete mode in the VARI-MATRIX and SQ DECODER positions.

**4. BUFFER AMPLIFIER**

Signals passed through the MODE switch are then low-impedance-transferred through the buffer amplifier, thus obtained low-impedance outputs are then led to the balance and volume circuits.

**5. BALANCE CONTROL**

Signals passed through the buffer amplifiers go into the balance control circuits, in which the signals are controlled by three balancers: the FRONT L-R, REAR L-R, and FRONT-REAR. By setting the FRONT-REAR balancer to the "FRONT" side and the FRONT L-R balancer to the "L" side, for example, only the front left (LF) channel is driven.

**6. PRE-AMPLIFIER**

Signals passed through the balance and volume control circuits are led to the tone control circuits. Hi and low frequency response can be varied with the BASS, MID and TREBLE controls. These controls permit separate adjustment of front stereo pair of channels (LF, RF) and rear stereo pair of channels (LR, RR).

**7. MAIN AMPLIFIER**

The output signals from pre-amplifier are led to the main amplifier through the highcut filter circuit. The transistors H601 and H603 from a differential amplifier, directly coupled to the transistor H605.

The transistor H605 drives the inverters H611 and H613 which, in turn, drive the power stage consisting of H001 and H002. Transistors H607 and H609 compose a protection circuit.

The protection circuit will operate when an excessive current flows into the power transistor,

to limit current or to control the power transistors so that do not operate beyond the safety area.

In case either excessive current flows, or the load becomes almost entirely reactive, in the power stage, the transistors H607 and H609 and the diodes H622 and H624 are operated through the resistors R642 and R644, so that the power transistors are protected from damage.

## 8. BTL (Balanced Transformerless) CONNECTION

This power amplifier is designed to operate in either 2-channel or 4-channel modes, depending on the setting of the POWER MODE switch that incorporates phase-conversion and power switch for BTL connection.

With this switch placed in the 25Wx4 position, this unit operates as a 25W 4 channel amplifier. With the switch placed in the 70Wx2 position, the unit operate as a 70W 2 channel amplifier, in which case, the power output is obtained only from FRONT SPK terminals.

The transistor H626 convert the phase of channel-1 amplifier and channel-3 amplifier.

## 9. POWER SUPPLY UNIT

The power supply unit consisting of the transistors H801 and H802, operating as an automatic voltage regulator, provides +35V DC to all the amplifiers except the main amplifier.

The transistors H803, H804 and H805 operate the relay L801 that protects speakers from destruction, and has a time lag of from three to five seconds, for other transistors to work stably.

## 10. TROUBLE ANALYSIS

1. Excessive line consumption
  - a. Check for shorted H851 through H854, C003, C004.
  - b. Check for shorted transistor H001 through H008.  
Check L001 for short.
2. No line consumption or zero bias
  - a. Check line cord, fuse, shorted H581, H582.
  - b. Check for open rectifiers H851 through H854, or open L001.
3. Excessive hum and noise
  - a. Check filter capacitors C003, C004, H801, H802.
4. Parasitic oscillation
  - a. Check for defective C607, C608, C619, C620, C621, C622.

## 11. POWER AMPLIFIER ADJUSTMENT

1. Connect a VTVM between J629 and J613 and adjust the trimming resistor R628 until the VTVM reads 10mV DC. For the other channel, connect the VTVM between J630 and J614 and adjust the R629 for the same reading.
2. Connect a VTVM between J623 and J629 and adjust the trimming resistor R613 until the VTVM reads 0V DC. For the other channel, connect the VTVM between J623 and J630 and adjust the trimming resistor R614 for the same reading.

## 12. POWER SUPPLY ADJUSTMENT

Connect a VTVM between J802(-) and J804(+) and adjust R806 until the VTVM reads 35.0V under no signal condition.

## 13. METER ADJUSTMENT

1. Connect the audio oscillator to the AUX input, set audio oscillator frequency to 1KHz. Set SELECTOR switch to AUX.
2. With the distortion analyzer connected across the output load (8-ohm), set the analyzer on the 30V AC scale.

3. Apply the audio oscillator output until the distortion analyzer indicates 15V and adjust the trimming resistor R551 until the meter indicator reads +2.

**14. TEST EQUIPMENT REQUIRED FOR SERVICING**

Table 1 lists the test equipment required for servicing the Model 4140 Solid-State Quadradial Console Amplifier.

Item	Manufacturer and Model No. (or equivalent)	Use
Distortion Analyzer	Hewlett Packard, Model 331A or 333A	Measures distortion and voltage of amplifier output.
Audio Oscillator	Weston Model CVO-100P (NOTE: Less than 0.02 percent residual distortion is required.)	Sinewave and squarewave signal source.
Oscilloscope	Tektronix, Model 503; Data, Model 555	Waveform analysis and trouble shooting.
VTVM	RCA Senior Volt-Ohmyst, model WV-98C	Voltage and resistance measurements.
AC Wattmeter	Simpson, Model 390	Monitors primary power consumption of amplifier.
AC Ammeter (0 to 10 amps)	Commercial Grade	Monitors amplifier output under short circuit condition.
Line Voltmeter (0 to 150 vac)	Commercial Grade	Monitors potential of primary power to amplifier.
Variable Autotransformer (0 to 140 vac, 10 amps).	Powerstat, Model 116B	Adjusts level of primary power to amplifier.
Shorting Plug	Use phono plug with 600 ohms across center pin and shell.	Shorts amplifier input to eliminate noise pickup.
Power Supply Bleeder Resistor (10 ohms at 1W)	Commercial Grade	Discharges power supply filter capacitors prior to disassembly or resistance measurements.
Output Load Resistor (8Ω ± 0.5%, 100W)	Commercial Grade	Provides 8-ohm load for amplifier output termination.
Output Load Resistor (4Ω ± 0.5%, 100W)	Commercial Grade	Provides 4-ohm load for amplifier output termination.

Table 1 Test Equipment Required for Servicing

## 15. PERFORMANCE VERIFICATION

### Test Procedure

#### A. Test Equipment

Refer to Table 1 for required test equipment.

#### B. Preliminary Procedures

1. Make the test setup shown in Figure 1 with the instrument controls set in the following positions:

Line Switch	off
Variable-line Switch	variable
Watt Meter Switch	on
Variac	0 (fully CCW)
Load	8 ohms (0.5 mfd – off)
Audio Generator	frequency 1 KHz
Output	5V range
Gain	minimum
AC Volt Meter	30V range

2. Make sure that connections between the resistive load and the system terminals of the Model 4140 have negligible resistance compared with the resistance of the load itself. Appreciable resistance in wiring adds to the total load, resulting in inaccurate measurements of output power.
3. Connect amplifier output to load and connect AC cord to line power. Connect a shorting plug to the PHONO input jack of the model 4140.
4. Remove the top cover.

#### C. Total Hum and Noise Test

1. With shorting plugs connected to the CD-4/AUX input jacks and a 8-ohm resistive load connected across the speaker system output terminals, connect a distortion analyzer across the load.

NOTE: In this test and tests that follow, if distortion analyzer used does not contain a built-in voltmeter, a VTVM may be substituted.

2. Set the distortion analyzer controls for voltage measurements and apply power to the amplifier. Set the VOLUME control fully CCW. Set the SELECTOR switch to CD-4/AUX and the MODE switch to DISCRETE.
3. If the distortion analyzer indicates more than 1.5mV, refer to the trouble analysis section of this manual.
4. Set the VOLUME control fully CW. If the distortion analyzer indicates more than 2mV, refer to the trouble analysis section of this manual.

#### D. Maximum Power Output

1. Connect the audio oscillator to the CD-4/AUX input. Set audio oscillator frequency to 1 KHz. Set SELECTOR switch to CD-4/AUX.
2. With the distortion analyzer connected across the output load (8-ohm), set the analyzer on the 30 AC scale.
3. Turn the analyzer on and increase the audio oscillator output to 180mV, and verify the analyzer indicates more than 14.2V.

#### E. Harmonic Distortion Test

1. Set the frequency of the audio oscillator and the distortion analyzer to 20 KHz.
2. Set the controls of the analyzer for voltage measurement on the 30-volt scale.
3. Adjust the audio oscillator output level until the analyzer meter indicates 10.9 volts.
4. Switch the distortion analyzer to Set Level – Manual mode, and adjust SENSITIVITY for full scale reading on 0-1 scale.

5. Measure the total harmonic distortion with the analyzer and verify it is less than 0.3%.  
NOTE: Any parasitic oscillation in the amplifier will be displayed on the oscilloscope, when capacitance is switched into the load.
6. Switch the distortion analyzer back to SET LEVEL MANUAL.  
(Do not adjust sensitivity of analyzer.)
7. Change the frequency of the audio oscillator and distortion analyzer to 1KHz. Adjust audio oscillator output as necessary to have a full scale reading on the 0-1 scale on the analyzer.
8. Measure the distortion, verifying it is no greater than 0.3%.
9. Repeat steps 7 and 8, changing frequency to 20Hz.  
Distortion should be no more than 0.3%.
10. Check for parasitic oscillators; there should be none.

**F. Channel Separation**

1. Set audio oscillator to 20KHz. Connect oscillator to front left channel CD-4/AUX input only, with shorting plug (10K ohm) in all other channels CD-4/AUX input. Connect distortion analyzer to front left channel speaker output terminals.
2. Adjust oscillator output until distortion analyzer indicates 0 dB (2.8V).
3. Measure RF, LR, RR channel output. Distortion analyzer should indicate -30 dB or less.
4. Repeat step 1 and 2 with substituted channel driving.
5. If indication is not less than -30dB, adjust input wires to preamp board until reading is -30dB or less.

**TECHNICAL SPECIFICATIONS**

Input Impedance-Low level input .....	Phono 47 Kohm
-High level input .....	100 Kohm
Input Sensitivity-Phono .....	2.0mV for 25W output
-High level .....	150mV for 25W output
Frequency Response .....	1.0dB, 20Hz to 20KHz at 1W output
Intermodulation Distortion .....	Less than 0.3% at rated power output (S.M.P.T.E.)
Total Harmonic Distortion .....	Less than 0.3% at rated power output 20Hz to 20KHz with all channels driven
Damping Factor .....	Greater than 40 into 8 ohm load
Total Noise-From magnetic phono input to power amp output .....	Less than 2.8 $\mu$ V equivalent input at rated output into 8 ohm load
Volume Tracking .....	Within 3dB
Rated Continuous (RMS) Output per channel, all channels operating simultaneously .....	25Wx4 at 8 ohms 70Wx2 at 8 ohms
Comparable Total Music Power .....	150W at 8 ohms

**GENERAL**

Power Requirements .....	120V AC 50 to 60Hz
Power Consumption-at rated power output, all channels .....	400 watts
-idling (no signals) .....	25 watts
Dimensions-Panel Width .....	15-3/8 inches
-Panel Height .....	5-3/4 inches
-Depth .....	14-3/8 inches
Weight-Unit alone .....	33 lbs
-Packed for shipment .....	40.7 lbs

\* These specifications and exterior designs may be changed for improvement without notice.
