SPECIFICATIONS

| | | |
|------------------------------|--|---------------|
| Display | Monochrome touch screen LCD with 4 gray levels and digital contrast control. Resolution: 160 x 100 pixels Blue EL backlighting for LCD and hard buttons | |
| Interface | 3-wire (RS232) serial port connector | |
| Software | Built-in Marantz RC codes Total number of devices limited only by memory | |
| Infrared (IR) | Infrared sending LED and learning eye Operating distance of 33 feet (10 meters) Learning frequency up to 56 kHz and 455 kHz Learning distance 1 inch (2 cm) up to 4 inch (10 cm) 2-way communication with specific marantz equipment | |
| Memory | 1 MB non-volatile flash memory | |
| Batteries | 3 AA-batteries (3 x 1,5V): primary or rechargeable | |
| Power management | Power on by tapping the LCD touch screen or by pressing the Backlight button Power off automatically | |
| Dimensions | 7.8 inch x 3 inch x 1.3 inch (177mm x 74mm x 33mm) | |
| Operating temperature | 41°F to 113°F (5°C to 45°C) | |
| Accessories | only for RC3200/U1S/M1S | only RS3200/A |
| | RS232 cable for PC connection | None |
| | IFU RC3200 | |
| | 3 AA-batteries | |

SERVICE HINTS

-RC3200 information

Press and hold the **Mode** button for 3 seconds -Tap **SETUP** - go to page3/3 with page up or page down button.

This page contains following information:

Free memory :

Boot version :

System version :

Application version :

Configuration file :

-Cleaning RC3200

Use a soft, damp cloth to clean the RC3200

If the LCD touch screen is dirty, clean it with a soft cloth moistened with a diluted window-cleaning solution.

After a repair please make the LCD touch screen always clean !

-Update the RC3200

Please check after each repair the RC300 application version.

Check the version on the website. Is the version higher on the website, please download the new version from the Firmware.

You can find this on the Marantz website <http://www.marantz.com>

DISMANTLING HINTS

1. Remove battery lid
2. Remove label a little. see picture 1
3. Remove 3 x screw as shown in picture 1

4. Put a sharp knife between toppart and bottompart and use this as lever to separate the two parts. see picture 2

CIRCUIT DESCRIPTION

1 Power supply

Components: 7201

The power supply makes use of the LT1761 low drop linear regulator of Linear Technologies. The output voltage is 3.3V.

2 Reset & delayed reset.

Components: -reset: 7202

-delayed reset: around 7203, 7204

The S-809 (Panasonic) detects the hardware reset level of the batteries. Below this level (2.8V) reset is passed to the "delayed reset" circuit.

The "delayed reset circuit" is activated by the S-809 or the reset switch 1203. It will delay the reset signal by approx. 80ms and has a hysteresis of 200mV

3 Battery level measurement

Components: around 7206, 7207

The battery voltage is measured via a 1:2 divider by the master microcontroller. This divider is switched on/off by the master by means of 7206 and 7207.

4 EL-foil driver

Components: around 7205

The EL-sheet is driven by the D371 (Durel). This component generates a high-voltage semi sinewave by switching a coil of 2.2mH. It contains 2 oscillators: a high-frequency oscillator switching into the inductor at approx. 17kHz. A low-frequency oscillator drives the EL-sheet at approx. 500Hz. The EL-sheet is driven with approx. 75V_{peak}.

Zener diodes 6208 and 6209 limit the sinewave voltage when no sheet is attached (during repair of the unit).

5 +/- 17V generator

Components: around 7210

The + and - 17V are generated by the MC64063A, a DC-to-DC converter who is used in a step-up configuration.

The switching frequency ranges up to 150kHz (depending on the load) with ringing on the edges of approx. 3MHz.

The generator is switched on/off via 7208 and 7209 from the master microcontroller.

6 Master microcontroller & memories

Components: 7101, 7115, 7103, 7102

The master is the main microcontroller in the system (M30800, Mitsubishi). It uses external flash program memory (AM29LV800BT, AMD) and SRAM (CY62256V, Cypress). Address selection is performed with 74LV139.

The master runs from two crystals: 7.3728MHz, only running when active. The other crystal of 32.768kHz is always running, even in sleep mode.

7 Buzzer

Components: around 1103

The sound function is made by a piezo-electric buzzer. The steering frequency range is 200Hz ~ 8kHz.

8 RS232 transmitter

Components: around 7105, 7106

This circuit converts the RS232 outgoing signal from the master between 0 and 3.3V to -15 and +15V levels.

RS232 communication is set at 115kBaude both directions.

9 RS232 receiver & detection.

Components: around 7107, 7108, 7109

Transistor 7107 converts the incoming RS232 signals between +/-15V into 0-3V levels towards the master.

Transistors 7108 and 7109 perform a RS232 incoming signal detection and interrupt the master during sleep mode when communication starts from a connected PC.

10 Touchscreen.

Components: around 7111, 7112, 7113, 7114

A resistive touchscreen is used, composed of two layers of resistive material. Pressing the screen causes a short-circuit between the two layers.

The touchscreen is operated in two steps:

1. detection of a touch
2. reading of the actual position of the touch

Detection is done by connecting one layer to ground and the second layer to 3.3V with a pull-up resistor. The voltage on the second layer will change from 3.3V to 0V when touching.

Readout is performed in 2 phases, each determining one coordinate.

First, layer 1 is connected between 3V3 and ground. The potentiometric position of the touch location can be read by measuring the voltage on the layer 2.

The other coordinate is read by interchanging the layers in previous procedure.

CIRCUIT DESCRIPTION

11 LCD

Components: 1101

The LCD module (Wintek) is a STN type 100x160 pixel including the driver HD66421 of Hitachi. The touchscreen is glued on top the the LCD module.

The LCD module uses a 8 bit bus directly interfacing to the databus of the master.

It uses two voltages: 3.3V for the logic and 17V for the LCD glass drive.

The LCD driver uses a clock of approx. 190kHz to generate all timing.

12 Keyboard

Components: 0102, etc...

The keyboard is a matrix of 6 x 3 keys. It is static when no key is pressed, and scanned when a key is applied.

13 Slave microcontroller

Components: 7301

The slave microcontroller M37540M4 (Mitsubishi) takes most of the real-time functions: IR-sending, IR learning and steering the database microcontroller.

Sending IR is performed via pins 28 and 29, combining envelope and carrier with AND-gate 7302.

Transistors 7303 and 7304 combine the IR-sending signals from slave uC and database uC towards the IR-transmitter circuit. The slave uC also switches on/off the power of the learning circuit via 7305.

Bidirectional communication to the master uC goes via a UART at 57kBaud.

Communication to the database uC goes via a 3-line dedicated bus.

14 Infrared transmitter

Components: around 7307, 7308

The IR-transmitter transmits any IR-code coming from slave or database uC.

It steers two IR-transmission diodes with a peak current of approx. 300mA in each of them.

The IR-diodes transmit invisible infrared light at 940 nm in an angle of 2 x 25 degr.

An electrolytic capacitor of 100uF smoothen-out the carrier frequency in order to have only the average current flowing from the batteries (envelope of the IR-code).

There are many many brands with each several IR-codes. Basically, all codes consist of a low bitrate burst (around 1kbit or slower) modulated on a carrier of 30 - 60kHz, and repeated at a rate of 5 - 20Hz.

15 Learning circuit

Components: around 7309, 7310

This circuit is used for learning IR-codes. It uses signals captured by the IR-transmission LEDs 6301 and 6302. Transistor 7309 amplifies the signal. Opamp LM393-B puts a minimum threshold and amplifies further. The output of LM393-B contains the carrier frequency and is fed to the slave IC for carrier frequency measurement. The output is also fed onto a detector. This has a time constant suitable to detect to the envelope signal of the IR-code. Opamp LM393-A cleans up and its output is fed also into the slave uC for envelope recording.

16 IR - Receiver

Infrared receptor 6306 and surrounding components

17 Not implemented functions (in circuit diagram)

Some of the parts in the circuit diagram are actually not stuffed on the board.

RS transmitter module 1301

Overview of frequencies

EL-foil driver D371A: 17kHz, 500Hz (75Vpeak)

+/-17V generator: 150kHz, 3MHz ringing

crystals master uC: 7.3728MHz, 32.768kHz

resonator slave uC: 3.64MHz

resonator database uC: 4MHz

RS232 speed: 115kBaud

baudrate between master & slave uP: 57.6kBaud

LCD internal clock: 190kHz

IR-transmission: carrier frequencies: approx. 30 - 60kHz

List of EMC-critical components

Critical components for EMC are:

- The EL-foil generator (high voltage)
- All crystals
- The data & address busses of the master uC to the Flash, SRAM and LCD module
- The IR-transmitter (high current)

TROUBLESHOOTING

General Problems

The display stays blank or becomes black

- Make sure the batteries are properly installed.
- Press the Backlight button to make sure RC3200 and the backlight are turned on. See 'Turning on the Display and the Backlight'
- Adjust the contrast using the Backlight button and the Page Up or Page Down buttons on the left side of RC3200. See 'Changing the LCD Contrast'

The display is too light or too dark

- Adjust the contrast using the Backlight button and the Page Up or Page Down buttons on the left side of RC3200. See 'Changing the LCD Contrast'

RC3200 shuts off automatically

- This is a timeout feature of the RC3200 to save power. You can change the time RC3200 stays on in the Settings. See 'Adjust the LCD Timeout'

Devices do not respond to commands from RC3200

- Make sure RC3200 is in Use mode. See 'Working with Modes'
- Make sure RC3200's sending LED is pointed towards the device you're operating.
- Check if the battery level is low. If so, replace the batteries.
- Check that you have correctly learned the IR commands. See 'Tricks for Remote Controls that are "Difficult"'
- If the button is programmed with a macro, and all other buttons are working correctly, reprogram the macro. See 'Recording Macros'

RC3200 does not learn commands from an existing remote control

- Do not learn commands directly under fluorescent lights.
- Do not learn commands on a reflecting table surface.
- Check if the battery level is low. If so, replace the batteries.

RC3200 is not recognized by the RC3200 Setup Programming Software software

- Make sure the serial cable is properly connected. See 'RC3200 Setup Programming Software'
- Disconnect other equipment connected to the serial ports, e.g. PDA's.
- Plug the serial cable in another serial port.
- Try to connect multiple times.

Programming Problems

Buttons are not sending the correct commands

- Check whether the button of the device is learned properly. See 'Learning From Other Remotes'
- Check whether the macro is recorded properly. See 'Recording Macros'

RC3200 will not switch modes

- Replace the batteries. When the batteries are low RC3200 prevents you from switching to customizing modes so that no customization can get lost.

RC3200 is low on memory

- Revert the RC3200. See 'Revert'

The configuration file is corrupted

- When this unlikely event occurs, you have to revert to the original configuration or use RC3200 Setup Programming Software to download a new configuration file. All your customized commands and devices will be lost and you will have to reprogram your RC3200. If you use RC3200 Setup Programming Software, it is advised to make backup copies of your customized configurations. See 'Revert' and 'RC3200 Setup Programming Software'

RC3200 error message

If the error message 'Invalid CF version or corrupt Flash!' occurs:

- Use the Reset button on the back of the RC3200. See 'How do I reset the RC3200?'
- Try to recover the RC3200 Configuration File (NCF) by downloading a backup copy or the default file from RC3200 Setup Programming Software. See 'RC3200 Setup Programming Software'
- Go to the Marantz website <http://www.marantz.com> for more information.

- Turning on the Display and the Backlight

RC3200's display can be activated in three different ways:

Tap the touch screen gently with your finger or a blunt, soft object like a pencil eraser.

The display is activated. Press any button on the RC3200.

The display is activated. Press the Backlight button on the left side of the RC3200.

The display and the backlight are activated.

If the LCD touch screen stays blank or becomes black when turning on the display, read the next section 'Changing the LCD Contrast' to adjust the contrast of the LCD touch screen.

Note: RC3200 has a timeout feature: the LCD touch screen and the backlight

automatically turn off to save power. See 'Adjusting the Settings' to adjust the timeout for the LCD and the backlight.

TROUBLESHOOTING

- Changing the LCD Contrast

To adjust the LCD contrast on the touch screen:

1 Press and hold the **Backlight** button.

The screen lights up.

2 While still holding the Backlight button, press the **Page Up** button once to increase the LCD contrast one level.

The LCD contrast is adjusted one level up.

–or–

Press the **Page Down** button once to decrease the LCD contrast one level.

The LCD contrast is adjusted one level down.

3 Release the **Backlight** button when the contrast is satisfactory.

The LCD contrast can be adjusted 16 levels.

Note: To adjust the contrast multiple levels, you have press the Page Up or Page Down button multiple times. When you press and hold the Page Up or Page Down button, the LCD contrast will only change one level.

- Operating Devices

To operate devices on your RC3200 you have to switch to the Device overview. This screen displays the available devices like TV, VCR, DVD, PreAmp and so on.

- Adjusting the Settings

The RC3200 settings can be adjusted in the Setup mode.

Press and hold the **Mode** button for 3 seconds.

- Adjust the LCD Timeout

The LCD timeout indicates how long the LCD touch screen stays active before it turns off. The LCD will only time out when you don't touch any buttons. You can set the timeout between 1 second and 120 seconds.

Press '+' to increase or '-' to decrease the time the LCD stays active.

Tap '+' or '-' once to adjust the timeout 1 second up or down.

Press and hold '+' or '-' to adjust the timeout per 10 seconds up or down.

- Working with Modes

RC3200 starts up in Use mode. In this mode you operate your devices. For customizing the RC3200 (adjusting the settings, defining brands, learning buttons, labeling buttons and devices or recording macros) you have to switch to the appropriate mode via the menu that appears when you press and hold the mode button.

The RC3200 can be put into 4 different modes. These modes are:

Use mode: Normal operating. See 'Operating Devices'

Setup mode: For changing the RC3200 system settings. See 'Adjusting the Settings' for more details.

Learn mode: For learning commands from other remote controls. See 'Learning Commands' for more details.

Macro mode: For recording macros. You can assign multiple commands to one single button. See 'Recording Macros' for more details.

Note :Learning commands and recording macros is not possible from either of the Home pages. You must select a device or the Macro group first, then press and hold the Mode button perform.

- Learning From Other Remotes

If you own any non-Marantz components, you can program RC3200 to reproduce IR signals from your existing remote controls via RC3200's learning eye. To do this, place RC3200 and the device's remote control on a flat surface, 1 to 4 inches (2 to 10 cm) apart.

To learn commands from other remote controls, RC3200 has to be in Learn mode. Switching to Learn mode is only possible from a specific device, not from the Home Page. See 'Working with Modes'

Per device you can learn all soft and hard buttons on the RC3200, except for:

- the Backlight button;
- the Back and FWD buttons;
- the Page Up and Page Down buttons;
- the "S" (Status) button;
- the Home button.

The Learn Sequence

1 From the Home page, select the device, e.g. TV, with the buttons you want to teach new commands to.

2 Press and hold the **Mode** button for 3 seconds. The Mode screen appears.

3 Tap **Learn** on the Mode Menu. RC3200 is now in Learn Mode. 'Learn' and the label of the selected device appear at the top of the touch screen.

4 Use, if necessary, the Page Up or Page Down button to go to the next button you want to learn.

5 Press the soft or hard button you want to learn on the RC3200. The Learn label changes to Learning, which means RC3200 is ready to receive commands from an existing remote control. The RC3200 will wait for 3 seconds to receive an IR code from another remote control.

Note: When a hard button is pressed to learn, there is no on screen feedback to indicate which button is pressed.

TROUBLESHOOTING

6 Press and hold the button on the existing remote control you want to learn to the RC3200. When the RC3200 receives an IR code:

- You hear a confirmation beep;
- The label changes from Learning to OK. The Learn sequence has been successful. When the RC3200 does not receive an IR code in 3 seconds:
- You will hear an error beep;
- The label changes from Learning to Failed. The Learn sequence has failed.
- RC3200 will return to Learn mode. Return to step 5 of the Learn sequence to relearn the button.

Tip You do not have to wait for the OK or Failed to disappear. If you press another button (soft or hard button), the RC3200 Learn sequence immediately goes back to step 5.

7 Go to other pages of the selected device with the Page Up and Page Down buttons. Repeat steps 6 and 7 until you have copied all the commands of the existing remote control.

8 Press **Done** when you have finished learning commands to the buttons of your choice. RC3200 returns to Use Mode. You can try out the new IR codes or select another device to learn.

- Recording Macros

A macro allows you to send a sequence of commands using one single button. You can for instance, switch on your TV, turn to a movie channel and prepare your VCR for recording by rewinding the videotape. All this can be done by pressing a single button on your RC3200.

To record macros, RC3200 has to be in Macro mode.

1 Set the RC3200 in Use Mode. See 'Working with Modes'

2 Select the device, e.g. TV, with the buttons you want to program as a macro.

The device screen appears.

Note Basically, you can assign any button as a macro button. However, it is recommended to assign only the reserved macro buttons on the last page of every device. Use the Page Up and Page Down buttons to go to the last page of the device.

3 Press and hold the **Mode** button for 3 seconds. The Mode screen appears.

4 Tap **Macro** on the Mode screen. A message screen appears. RC3200 is now in Macro Mode.

5 Tap Next. The device screen with the Macro label appears. With the Page Up and Page Down buttons you can go to other screens of the selected device.

6 Tap the soft or hard button you want to select as a macro. A message screen appears.

7 Tap Start. The Device Overview appears with the 'Recording' label at the top of the screen. The buttons you tap on this screen will not be recorded. From the Device Overview you can go to the different devices or you can press the Extra hard button to go to the Extra screen with delays and beeps.

8 Tap the button of the device you want to go to. The device screen appears.

9 Tap the soft or hard buttons with the commands you want to record.

10 Press the Page Up and Page Down buttons to go to different screens of the same device. –or– Press the Device button to go to the Device Overview again.

11 To add delays and beeps to the macro, press the Extra hard button on the Device Overview. The Extra screen appears.

— 1 To add a delay, tap one of the Delay buttons. By tapping several Delay buttons, the duration of the delay will be increased.

— 2 To add a beep, tap the Beep button.

— 3 Press the Device button to go to the Device Overview again.

12 Press Stop to stop recording. A message screen appears.

13 Press OK to save the macro and return to the Mode screen. The existing command of the selected button is replaced by the macro. –or– Press Cancel to return to the Mode screen without saving the macro.

The button retains its previous command.

14 Set the RC3200 in Use mode to test the recorded macro.

- Tricks for Remote Controls that are "Difficult"

- Replace the batteries in your original remote control. Poor battery charge in the original remote will still operate original component from long range, but will corrupt carrier frequency learning
- Change distance. Try increasing distance up to 4 feet. Start in the normal 1" to 4" , then double the distance to 8" and so on.
- Use a short "Tap" instead of a press and hold. A press and hold is only really necessary when you are learning a button that in actual operation you would sometimes press and hold (e.g. volume up and down, fast forward scan). If your system is large and you are concerned about memory, try teaching most commands as taps rather than extended press and holds.
- The "Flicker" technique - rapidly tap the button while learning (7x per second or faster). This is very useful for difficult volume up and volume down commands from some manufacturers.
- The "Swoop" - Start from 2' away and swoop the remote towards the learning remote. Use in absolute desperation, out of sight from anyone who might see you. Reportedly works occasionally.
- The "Flasher" - Hold an opaque object in front of the remote and remove it then quickly replace it. This is especially useful when you want to capture one part of a macro from another remote.

TROUBLESHOOTING

- RC3200 Information

This page contains information that may be important to the dealer in case of a defect. The following information is displayed on this screen:

- Free memory (in percentage), which gives you an indication on how much memory is left to (further) customize the RC3200;
- Boot version;
- Application version;
- Configuration file.

- Revert

Warning When you revert the RC3200, all customization is lost permanently. You loose all RC3200 settings, defined brands, learned codes and recorded macros.

By tapping the Revert button the RC3200 will be reverted to the default configuration. Reverting to the original configuration restores the RC3200 to its initial state. You might have to revert when you notice that scrolling through pages is slowing down. This might be the case when you have added a lot of commands to the RC3200.

- 1 Tap the **Revert** button. A message screen appears to confirm or cancel the revert process.
- 2 Press OK or Cancel.

- RC3200 Setup Programming Software

If you want to personalize your RC3200 even more beyond its standard programming features, RC3200 Setup Programming Software is the tool for you to use.

You can find more information and updates of the software on <http://www.marantz.com>.

RC3200 Setup Programming Software is the visual editor for creating and configuring RC3200 Configuration Files (windows file extension NCF) on your computer. An NCF is a file that is used to define the RC3200 behaviour and look for the LCD touch screen.

Note It is advised to make backup copies of your own configurations. This can be done with RC3200 Setup Programming Software.

With RC3200 Setup Programming Software you can:

- define the types and brands of your devices;
- generate the Home Page;
- design the page layout and the appearance of buttons;
- configure the behavior of the hard buttons and soft buttons;
- save, duplicate and share NCFs, devices, buttons, bitmaps or codes with another RC3200;
- preview the NCF on the RC3200 emulator;
- download the new configurations to your RC3200 by means of the included serial cable;

1 Plug one end of the serial cable in the serial port on your computer. *see picture 1*

2 Plug the other end of the serial cable in the serial port on the RC3200.

Note When the RC3200 is connected to the PC, the battery lifetime may be reduced.

Minimum System Requirements

- PC with a Pentium 166 MHz or higher
- Windows 95/98/ME/XP or NT 4.0/2000
- 32 MB of RAM
- 16 MB of free hard disk space
- Free serial port

TROUBLESHOOTING

How do I reset the RC3200?

Under normal circumstances, you will never have to reset the RC3200.

However, on rare occasions, if the RC3200's touch screen freezes or if you notice unusual behavior, you need to perform a reset to get the RC3200 running again. All customized commands and devices are retained.

1 Slide the battery cover off the back of the RC3200. You will see the Reset button in the battery compartment.

2 Use an unfolded paperclip or a sharp pencil to carefully press the Reset button.

The RC3200 restarts and an Introduction screen appears.

The RC3200 beeps twice to indicate it is ready for use.

Reset button
