## MARANTZ MODEL SD8000 STEREO CASSETTE DECK

### INTRODUCTION

This service manual is prepared for use by Authorized Warranty Station and contains service information for Marantz Stereo Cassette Deck.

Servicing information and voltage data included in this manual are intended for use by the knowledgeable and experienced technician only. All instructions should be read carefully. No attempt should be made to proceed without a good understanding of the operation of the Cassette Deck.

The parts list furnishes information by which replacement parts may be ordered from the Marantz Company. A simple description is included for parts which can be usually obtained through local suppliers.

### 1. P.W. BOARD

As can be seen from the circuit diagram, the chassis, of the Model SD8000 consists of following units. Each unit mounted on a printed circuit board is described with in the square enclosed by bold dotted line on the circuit diagram.

Pre-Amp . . . . .	mounted on P.W. Board	PK11
Mic & Line Vol . . . . .	mounted on P.W. Board	PK12
Output Vol . . . . .	mounted on P.W. Board	PK13
Power Supply . . . . .	mounted on P.W. Board	P400
Computer . . . . .	mounted on P.W. Board	PK21
Remote Jack . . . . .	mounted on P.W. Board	PK26
Digital & Meter LED . . . . .	mounted on P.W. Board	PK22
Program Selector . . . . .	mounted on P.W. Board	PK23
Program . . . . .	mounted on P.W. Board	PK27
Timer Switch . . . . .	mounted on P.W. Board	PK24
Rec Mute Switch . . . . .	mounted on P.W. Board	PK25
Relay . . . . .	mounted on P.W. Board	P800
Photo Cuppler . . . . .	mounted on P.W. Board	P001
Mecha Logic Switch . . . . .	mounted on P.W. Board	PK31
Sensor Stop Switch . . . . .	mounted on P.W. Board	PK32
		PK33
FF. Rew Governor . . . . .	mounted on P.W. Board	PM01
Fuse (P or N) . . . . .	mounted on P.W. Board	P900

### 2. TEST EQUIPMENT REQUIRED FOR SERVICING REPLACEMENT

For measuring and checking the Model SD-8000, the following instruments and materials are necessary.

- Audio Oscillator (AF OSC)
- Attenuator (600 ohm)
- VTVM
- Distortion Meter
- Oscilloscope
- Bandpass Filter
- Wow and Flutter Meter
- Torque Meter (Cassette Type)
- Digital Frequency Counter
- Blank Tape (Completely erased with bulk eraser)

*	AC-211	(Normal)
*	AC-511	(CrO <sub>2</sub> )
*	CS-30	(Fe-Cr)
*	AC-701	(Metal)

**NOTE:** If any doubt is noted in a measured value, use a new tape.

- Test Tape (New Tape)
- MTT-111 . . . . . Wow and Flutter. Tape Speed.
- MTT-212 . . . . . Measurement of output level and (MTT-112) Signal to Noise Ratio.
- MTT-150 . . . . . Adjustment of output level.
- MTT-216 . . . . . Measurement of Frequency Response (MTT-116U) (For Normal)
- MTT-316 . . . . . Measurement of Frequency Response (MTT-116K) (For CrO<sub>2</sub>, Fe-Cr)
- MTT-121 . . . . . Cross Talk.
- MTT-141 . . . . . Channel Separation.
- MTT-112B . . . . . Playback Signal-to-Noise Ratio. (W.T.D. only)

### 3.4 RECORDING COMPENSATING CIRCUIT

(Tape Speed: 3-3/4 ips)

- S103 Tape Speed Switch
- S105 Tape Selector Switch CrO<sub>2</sub>
- S107 Tape Selector Switch Metal

In the circuit diagram, C150 and R163 are used for high range compensation.

L104, R168, R169, R170, R171 and C154, C155, C156, C157 form a peaking circuit. Peaking frequency and the amount of compensation are selected by the tape selector switch.

R165, R193 and C153, C166 are used for medium range compensation. The amount of compensation is selected by the tape selector switch (not available at "Normal" position).

### 3.5 BIAS OSCILLATOR CIRCUIT/ERASE OSCILLATOR CIRCUIT

The SD8000 has a bias oscillator circuit and an erase oscillator circuit to provide optimum bias and erase current for the use of metal tapes.

- The bias oscillator circuit is driven by a regulated amplifier power supply.
- The erase oscillator circuit is driven by the motor power supply.

The bias current for any particular type of tape is selectable by the circuit shown below (selection of bias current is independent of tape speed).

#### 1. Bias Oscillator Circuit

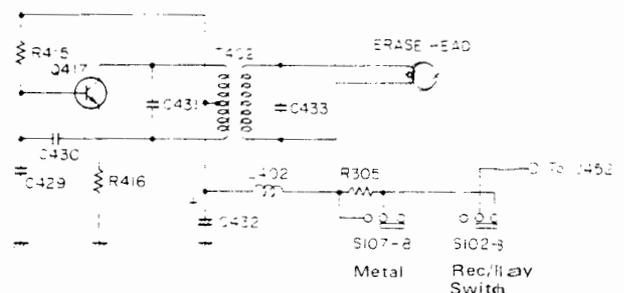

As shown below, by varying the Q302 base voltage, the bias oscillator circuit operational voltage is altered. In case of 4-3/4 i.p.s. (9.5 cm/sec), do not adjust by bias current. Adjust the recording EQ circuit, instead. Incidentally, R310 is the bias fine adjust control on the front panel.

	Normal	CrO <sub>2</sub>	FeCr	Metal
1-7/8 ips (4.75cm/s)	R411 R410	R315	R316	R314

#### 2. Erase Oscillator Circuit

The erase oscillator circuit consists of Q417 and T402. Only in case of metal tapes, R305 is shorted to increase the erase current.

### 3-6. CONTROL CIRCUIT OPERATION

#### 1. General

The SD8000 tape deck is designed to have a wide variety of functions such as time setting, timer setting, programming, counter function and memory function; all these are accomplished by a single 1-chip, 4-bit microcomputer element  $\mu$ PD546C.

Although the microcomputer performs complex functions, the control circuit is extremely simple.

In the microcomputer, the memory and control functions are processed together at high speed through the levels and timing of digital pulses available at input and output terminals.

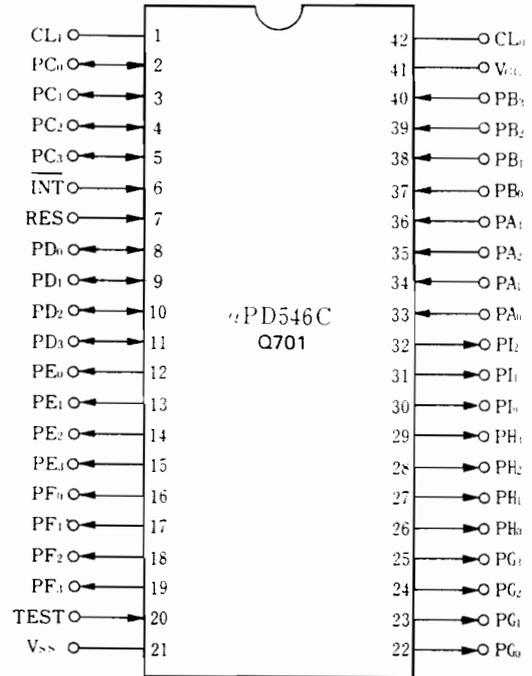

Since this instruction manual is limited in space, it is impossible to explain in detail the methods of measuring and checking the relationship between the input/output signals and their timing. Thus, this manual is intended only to cover the functions of operation buttons and matrix keys.

The SD8000 has various types of keys and switches to provide multiple operations, so special care should be taken when it is necessary to check the cause of trouble or misoperation.

This manual mainly deals with the functions of the SD8000 control circuit. Note that voltages and operating timing given in this manual are for reference purposes and are subject to change according to changes in power supply voltage and production tolerance of components.

Control signal input circuit

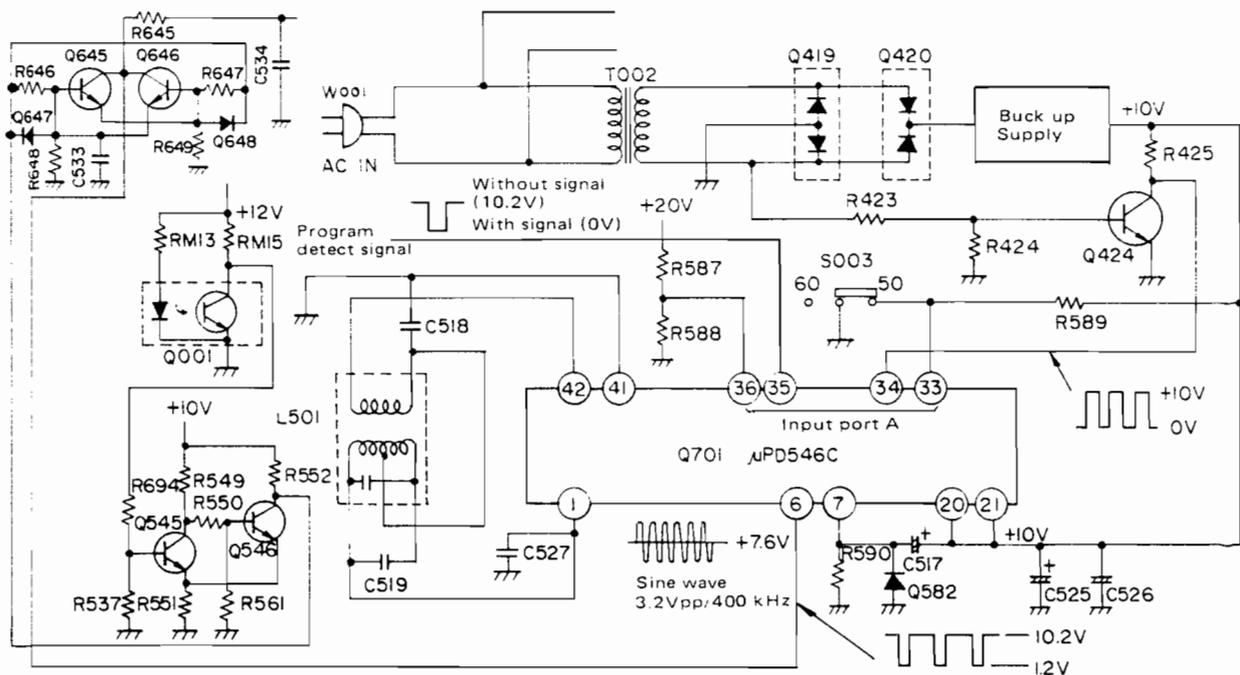

Fig. 2.3 Control signal input circuit

The Items (1) through (8) below are basic requirements for operating the microcomputer.

(1) Pin 1, 42

Pin 1 and pin 42 are the external terminals of the clock oscillator LC. The internal circuits of the microcomputer must be synchronized with the clock signal for proper operation. Incorrect oscillation of clock signal will result in misoperation of the microcomputer.

The clock signal at pin 1 should be a sine wave signal of about 3.2 V<sub>pp</sub>/400 kHz (including a 7.6V DC component).

(2) Pin 6

Pin 6 is the counter pulse input terminal. Pulses are counted by the up/down counter in the microcomputer. In the PLAY, FF or PAUSE mode, the pulses are counted up; in the REW or REVIEW mode they are counted down. When no counter pulses are preset at this terminal and tape is being transported, the COUNTER MEMORY will not function.

If the pulse input duration is less than 2.0 seconds, the tape deck stops automatically.

(3) Pin 7

Pin 7 is the reset signal input terminal. When a high level signal is applied to it, the internal circuits of the microcomputer are reset and all functions stop.

Pin 7 becomes high level just after the power is connected to the SD8000, regardless of whether the power switch is ON or OFF. Under normal circumstances, the voltage at Pin 7 is 0V.

(4) Pin 20, 21

Pin 20 is a test terminal and Pin 21 is the power terminal.

The test terminal is connected to the power supply since it is not used. The power voltage should be +10V ±1V.

(5) Pin 33

This is an input terminal for the power frequency select signal. The time signal of the SD8000 is obtained by dividing the power frequency, so the frequency divider in the microcomputer needs to be given the proper frequency division ratio according to the power frequency (50 Hz or 60 Hz).

When Pin 33 is 0V (GND), the frequency division ratio is 1/50, and when it is 10V, then the ratio is 1/60.

(6) Pin 34

This is the input terminal for the time and timer signals. A pulse signal of 10V with the power supply frequency should be applied to this terminal. Otherwise the correct time will not be indicated and the timer recording function will not operate correctly.

(7) Pin 35

This is the input terminal for the program detection signal. The programs to be played are controlled by the applied signals. When the deck is in the playback mode, this signal is 0V for recorded portions of tape, and 10V for blank portions between programs (where no signal are recorded on the tape).

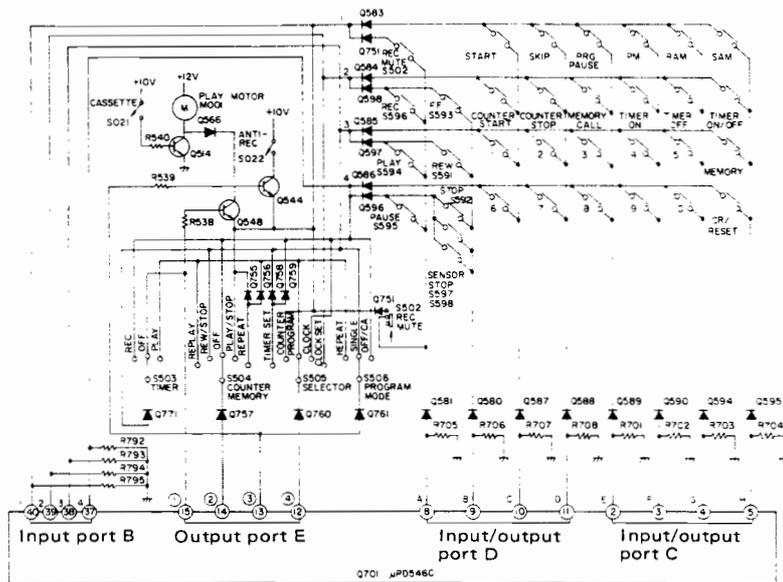

(8) Pin 36

Normally, a voltage of 10V is applied to this terminal. When the voltage becomes 0V, the display automatically indicates the time.

(9) Pin 31

This is the GND terminal.

Fig. 2.4 Operation/program signal input circuit

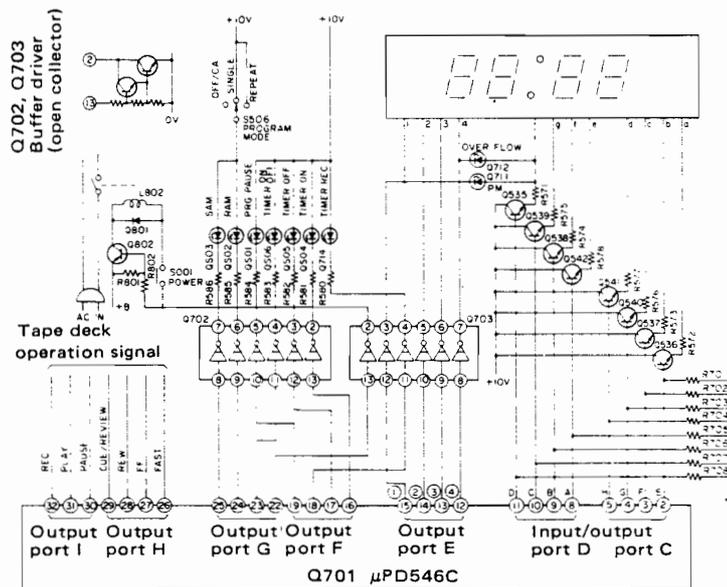

Besides the signals outlined previously, there are the input circuits for the operation signals (PLAY, FF, etc.) to select the mode of operation of the SD8000 and for the program setting signal (START, SKIP, etc.). Refer to Fig. 2.4.

In the microcomputer, these signals are synchronized with the clock signal and processed together to determine the mode of operation with the aid of the operation and program switches, input and output signals and their timing.

Operation/indication signal output circuit

Refer to Fig. 2.5

Fig. 2.5 Control/Indication signal output circuit

(1) Tape deck operation signal  
This signal is delivered from output ports H and I to determine the mode of operation of the tape deck. For example, in the PLAY mode, a high level signal is output by Pin 31 and the tape deck remains in the

PLAY mode as long as the signal is high level. In the timer recording (or playback) mode, a high level signal is output from Pin 22 of output port G. For the functions of the circuits in each operating mode, refer to Section 4 "Tape Operation".

### 3. Circuit

This Section is intended to explain the functions of the motors, solenoids and related circuits.

#### 3.1 Motor and solenoid

##### (1) Play motor (M001)

This FG servo DC motor is always rotating while a cassette is loaded and drives the capstan, i.e. the tape, at a constant speed. Winding torque is applied to the right reel disk during the PLAY or REC/PLAY mode.

##### (2) Reel motor (M002)

This FG servo DC motor is used to set the tape in FF, REW or CUE/REVIEW mode (CUE and REVIEW are performed in the fast forward and rewind modes respectively while programs are being played).

In each mode, the tape speed is maintained constant by means of the servo control system of the motor.

The reel motor rotates in the reverse direction when the deck is changed from the fast forward mode to the rewind mode. Either the left or right reel disk is driven according to the direction of the motor.

The reel motor is also used to remove slack in tape.

##### (3) Play solenoid (L001)

This solenoid functions when the deck is in the PLAY or REC/PLAY mode.

- The head base is lifted and the head contacts the tape.
- The pinch roller contacts the capstan and the tape starts running.
- Slight braking is applied to the left reel disk to provide back tension to the tape.
- The fast forward idler is set in the neutral position.

##### (4) Brake solenoid (L002)

This solenoid functions when the deck is in the PLAY, REC/PLAY, FF, REW, or CUE/REVIEW mode.

When it operates, the left and right reel disks are released to drive the tape.

##### (5) CUE/REV solenoid (L003)

This solenoid functions when the deck is in the CUE/REVIEW, PAUSE or REC/PAUSE mode.

In the CUE/REVIEW mode, the head base is lifted up to its middle position to permit the tape to contact the head. In the PAUSE or REC/PLAY mode, the capstan is released from the pinch roller and, at the same time, the play idler is disengaged from the reel to stop tape movement.

##### (6) Recording solenoid (L004)

This solenoid functions when the tape is in the REC/PLAY or REC/PAUSE mode to set the amplifier to the recording mode. When this solenoid is inoperative, the amplifier is in the playback mode.

#### 3.2 Back-up Circuit

When the power switch is OFF, back-up power is supplied to the microcomputer via T002, rectifier (Q419, Q424) and voltage regulator circuit (Q421 ~ Q423). In this case, the voltage at Pin 36 of Q701 is 0V, thus time is indicated on the display.

During back-up operation, the programs stored in memory remain uncleared.

#### 3.3 Solenoid drive voltage select circuit

The SD8000 is equipped with 4 solenoids. To ensure proper operation of these solenoids, a sufficient drive current is required.

If a large current flows into a solenoid, the solenoid is overheated which, in turn, increases the winding resistance and reduces the force of attraction of the solenoid. However, once the solenoid has been operated with a large current, it operates stable even with a relatively small current.

The SD8000 employs a solenoid drive voltage select circuit to select the operating voltage according to whether the solenoid is in the operating mode or holding mode.

Fig. 3.1 and Fig. 3.2 show the operating principles of the circuit in the PLAY mode.

Fig. 3-1 Solenoid drive voltage select circuit

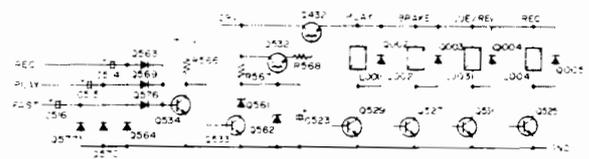

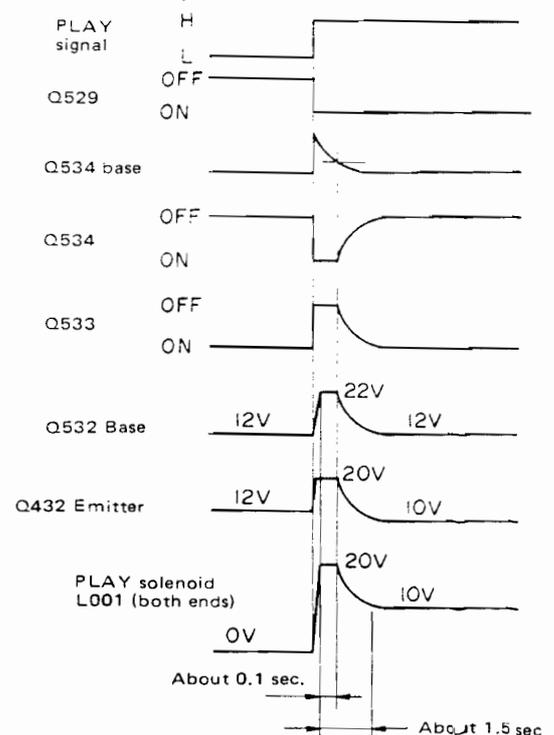

Fig. 3-2 Solenoid operation

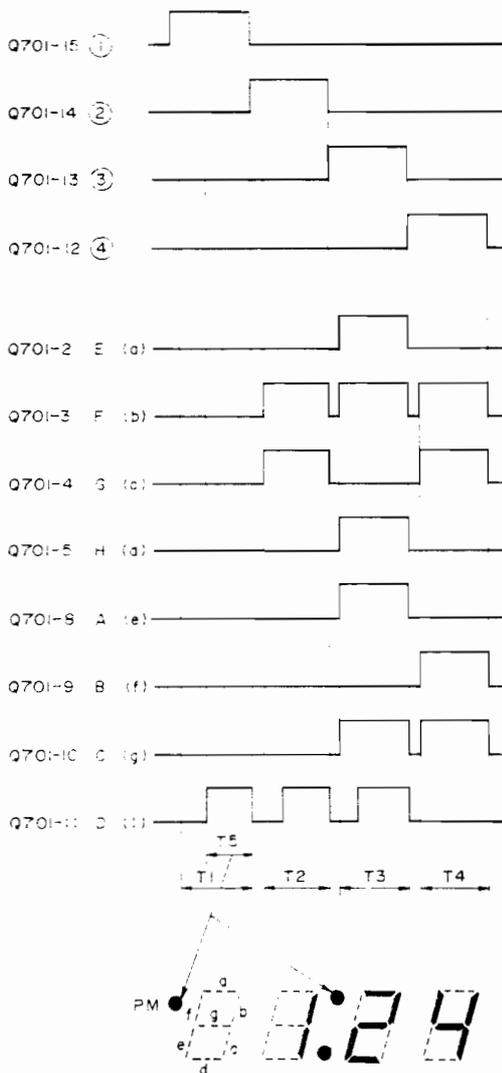

(2) Indication signal – 1

This signal is delivered from input/output ports C and D and output port E to drive the 7-segment LED, PM LED and OVER-FLOW LED in the display. For example, the following steps are taken for the display to indicate "1:24". Refer to Fig. 2.6.

- Strobe signals (1) through (4) are output from output port E, lighting the 7-segment LEDs one by one starting from the top digit.
- The 7-segment lamp signals are output from output ports C and D.
- The lamps of all the digits will light in sequence, but they appear to light simultaneously because the driving cycle is very short.

Fig. 2-6 Principle of displaying "1:24"

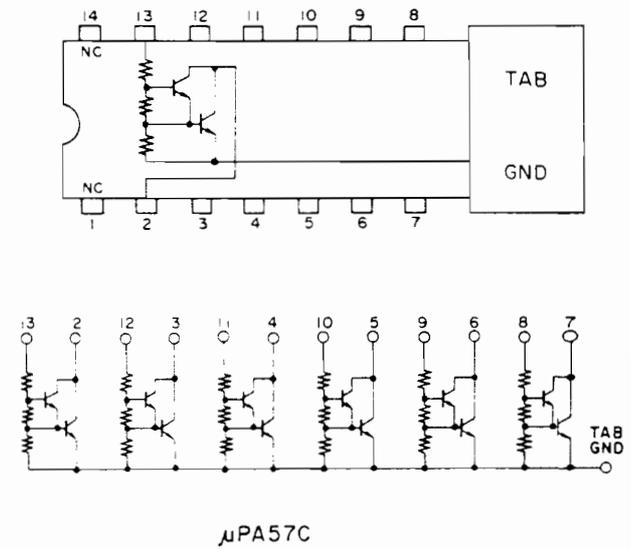

(3) Indication signal – 2

The LED lamp signals, used to indicate the mode of operation of the microcomputer, are output from output port F and output port G (excluding Pin 22).

The conditions required to light the LEDs are given in section 5 "Programming".

The Q702 and Q703 ( $\mu$ PA57C) are wired as shown in Fig. 2.7 to serve as a buffer driver.

Fig. 2-7  $\mu$ PA57C

- a. The PLAY signal level in the output of the micro-computer rises to "H" (this signal turns on Q529 and Q527 through a circuit via a separate route). (Fig. 3-1)
- b. The PLAY signal is differentiated, then passes through Q569 and turns ON Q534 momentarily. Q533 is OFF when Q534 is ON.
- c. When Q533 is OFF, a bias voltage of about 22V is applied to the base of Q532 through Zener diode Q562. At this time, the output of the emitter of Q432 is about 20V. Since Q529 and Q527 are ON, a voltage of 20V is applied to the PLAY solenoid L001 and the BRAKE solenoid L002 and hence they are driven by a large current.
- d. When Q534 is OFF, Q533 is ON so the base of Q532 is biased by Q561. As a result, the bias voltage is reduced to about 12V, causing the voltage at the emitter of Q432 to be reduced to about 10V and thus the solenoid is held closed at about 10V during the PLAY mode.

3.4 Tape end detect circuit

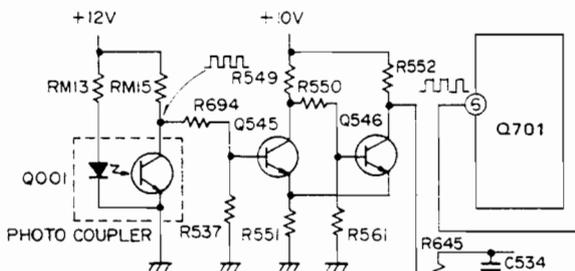

Fig. 3-3 Tape end detect circuit

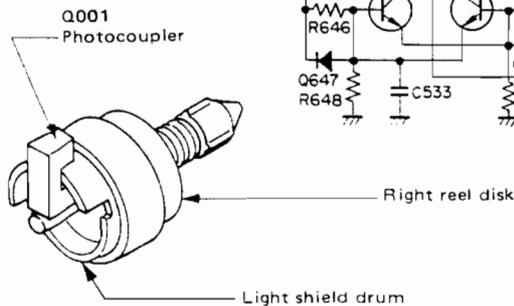

Fig. 3-4 Tapedrive detect mechanism

Fig. 3.3 shows the counter pulse generator circuit which also serves as the tape end detection circuit. Detection of tape end is accomplished by the mechanism shown in Fig. 3.4. When the right reel disk is rotating, the light shield drum attached to the reel disk also rotates. The light shield drum has two slits; photocoupler Q001 contains a light emission diode and a photo transistor. The light from the light emission diode arrives at the photo transistor only when the slits in the light shield drum pass through the photocoupler, energizing the photo transistor. When the light is blocked, the photo transistor is OFF. In other words, the photo transistor turns on twice for each rotation of the right reel disk. Since the photo

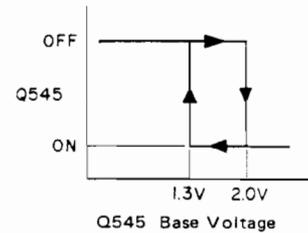

transistor's ON time is not stabilized and since it is de-energized between ON and OFF according to the position of the light shield drum, the waveform of the signal must be shaped by the Schmitt circuit consisting of Q545 and Q546.

As shown in Fig. 3.5, Q545 turns ON when the voltage is below 1.3V. Operation of Q546 is the reverse of Q545.

The shaped output waveform is applied to Pin 6 of Q701.

When the output pulse from Q546 stops in the PLAY, FF or REW mode, the microcomputer detects the end of the tape and the tape stops 1.5-2 seconds later.

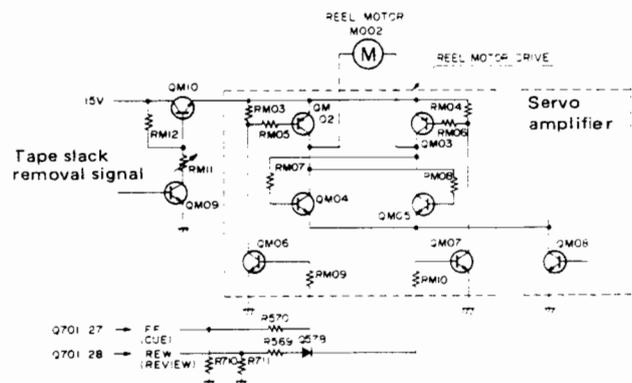

Fig. 3-5 Schmitt operation

3.5 Reel motor drive circuit

(1) Reel motor driver

Fig. 3-6 Reel motor driver

Under normal circumstances, QM09 is OFF and the base of QM10 is biased via RM12. The voltage at the emitter of QM10 is about 14V (load). When a high level FF signal is output from the microcomputer via Q701, QM06 turns ON via R570 and RM09. This reduces the signal level at the collector and thus QM02 turns ON. As a result, a current flows into the base of QM05 which will turn ON.

In the reel motor M002, a current flows along the route QM02 - M002 - QM05 - QM08 so that motor runs in the counterclockwise direction (as viewed from the pulley side) to drive the right reel disk.

The transistor QM08 in the servo amplifier functions as a variable resistor, controlling the reel motor current to provide a constant tape speed (refer to Item 3-8 "I").

In the REW mode, QM07, QM03 and QM04 turn ON. In this case, a current flows into M002 along the route QM03 - M002 - QM04 - QM08, so the motor runs in the reverse direction of this FF mode.

(2) Servo circuit  
Refer to Fig. 3.7

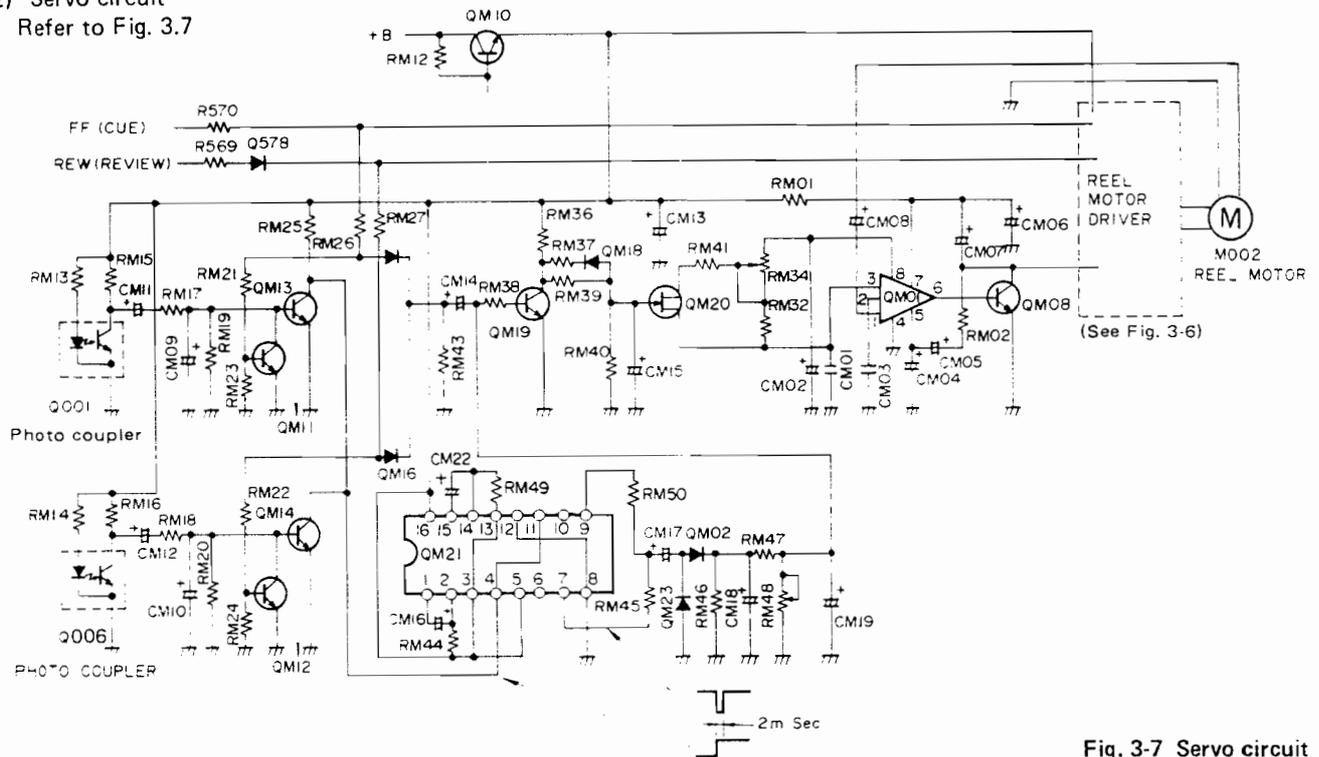

Fig. 3-7 Servo circuit

- a. Photocoupler Q001 is located on the right reel disk and Q006 on the left reel disk.
- b. In the FF mode, a high level signal from the micro-computer passes through R507, RM26 and RM21 to turn QM11 on. The signal from Q001 is not applied to other circuits as long as the tape is in the FF mode. In the REW mode, QM12 is ON and the signal to Q006 stops. (The FF mode operation is explained in the following.)

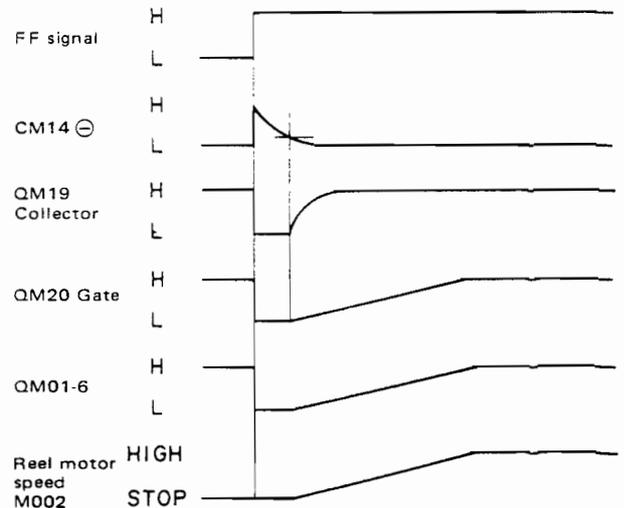

- c. In the STOP mode, CM14 and CM19 are uncharged, so the base of QM19 is at the GND level. QM19 is OFF and the collector voltage of QM19 is about 8.2V. When the FF signal of H level is output from the microcomputer, CM19 is charged through RM26, QM15 and CM14. The FF signal also biases QM19 for about 150 msec via RM38. Therefore, QM19 is turned ON and CM15 is quickly discharged through RM37 and QM18.

When the voltage (QM20 gate voltage) charged in CM15 drops, the resistance across the drain and source of QM20 is increased. With this resistance increased, the DC output voltage from Pin 6 of QM01 drops and the QM08 collector current (reel motor current) is decreased. Therefore, the reel motor starts running at a slower speed just after entering the FF mode. When CM14 is charged with the FAST signal, QM19's base voltage drops and the collector voltage is increased. CM15 is charged through RM36 and RM39 with a long time constant so CM20's gate voltage is increased slowly. As the gate voltage is increased, the drain-source resistance is decreased gradually, while QM01's output voltage is slowly increased. Thus, QM08's collector current is increased, thereby

increasing the speed of the reel motor gradually. Since the reel motor starts running at a slow speed, the tape will not become slack.

- d. In the FF (REW) mode, the tape drive detecting signal is fed from QM14 (QM13) to Pin 4 of QM21. QM21 ( $\mu$ PD4528C) is a unistable multivibrator which outputs low level pulses with a width of about 2 msec, from Pin 7 at the rise of the trigger pulses given to Pin 4. The pulse-width is determined by the power voltage, CM16 and RM44. Refer to Fig. 3B for the connection of  $\mu$ PD4528C and its block diagram.

Fig. 3-8-1 Reel motor rising characteristic

e. The output of QM21 is rectified, smoothed and applied to the base of QM19 as a speed control signal. The functions of the servo motor in the FF mode are as follows:

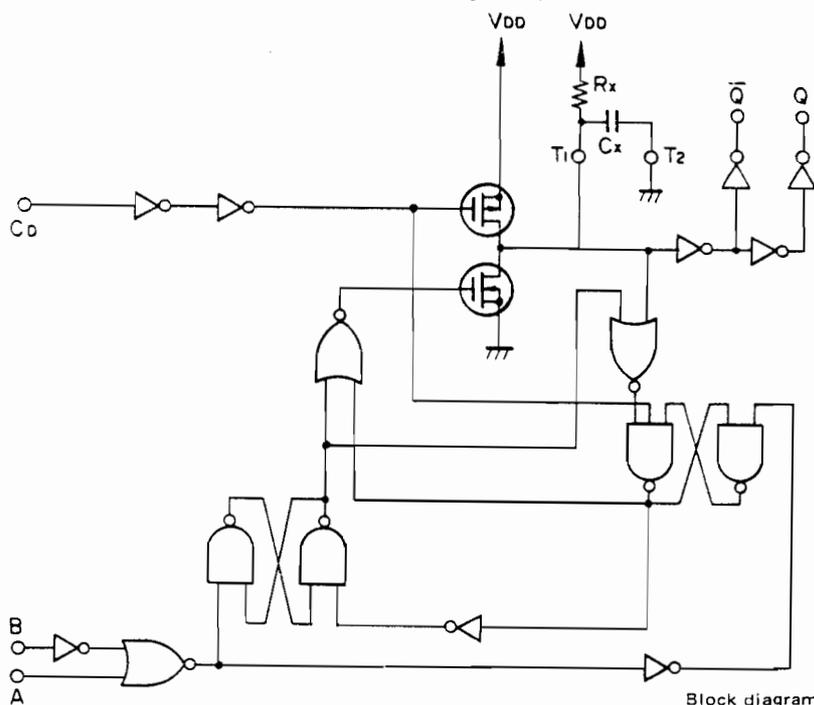

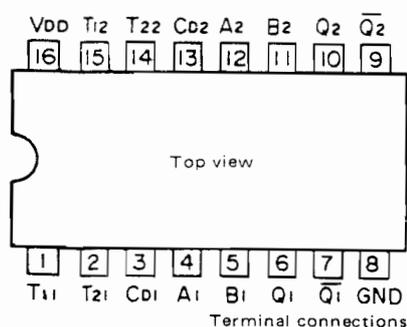

- \* At the start of tape, the left reel rotates at a slow speed because there is a large amount of tape. When the tape on the left reel is decreased, the speed of the reel is increased gradually and the interval of the input (trigger) pulses from Pin 7 of QM21 becomes shorter.
- \* With the trigger pulse-interval becoming shorter, the interval of the output pulses from Pin 7 of QM21 also become shorter.
- \* The interval of the pulses which are differentiated by CM17 and fed to the rectifier circuit become shorter, so the output voltage of the smoothing circuit is increased which increases the voltage at the base of QM19.
- \* With the QM19 base voltage increased, the collector current is increased, decreasing the collector voltage. Thus, the voltage at the gate of QM20 is lowered.
- \* With the gate voltage lowered, the drain-source resistance is increased, lowering the QM01 output voltage which decreases the QM08 collector current.
- \* The QM08 collector current is the current flowing into the reel motor. When this current is decreased, the motor runs at a slower speed. The reel motor drives the right reel disk. If the motor were to run at a constant speed, the tape would run slowly at the beginning of tape and at very high speed at the end of the tape. The servo motor is used to make the tape speed constant throughout the entire length of the tape by reducing the speed of the reel motor while the tape is running.

f. The pulse-width and voltages at the beginning and end of tape are as follows:

	Beginning of tape	End of tape
QM21-4 Trigger pulse interval	50 msec	30 msec
CM19 "+" Smoothing circuit output voltage	0.25V	0.62V
QM19 Collector voltage	8.8V	1.7V
QM20 Gate voltage	0.75V	0.15V
QM08 Collector voltage	5.8V	7.8V
Reel motor speed	Fast	Slow

- g. The purpose of maintaining the tape speed constant in every fast tape-feeding mode is to ensure stable operation of the program detecting function explained in a later section.
- h. The semi-fixed resistor RM34 in Fig. 3.7 is used to determine the maximum speed of the reel motor, while RM48 is used to determine the range of speed of the reel motor or the average speed of the tape.

Fig. 3-8  $\mu$ PD4528C unstable multivibrator

### 3.8 Program Detector Circuit

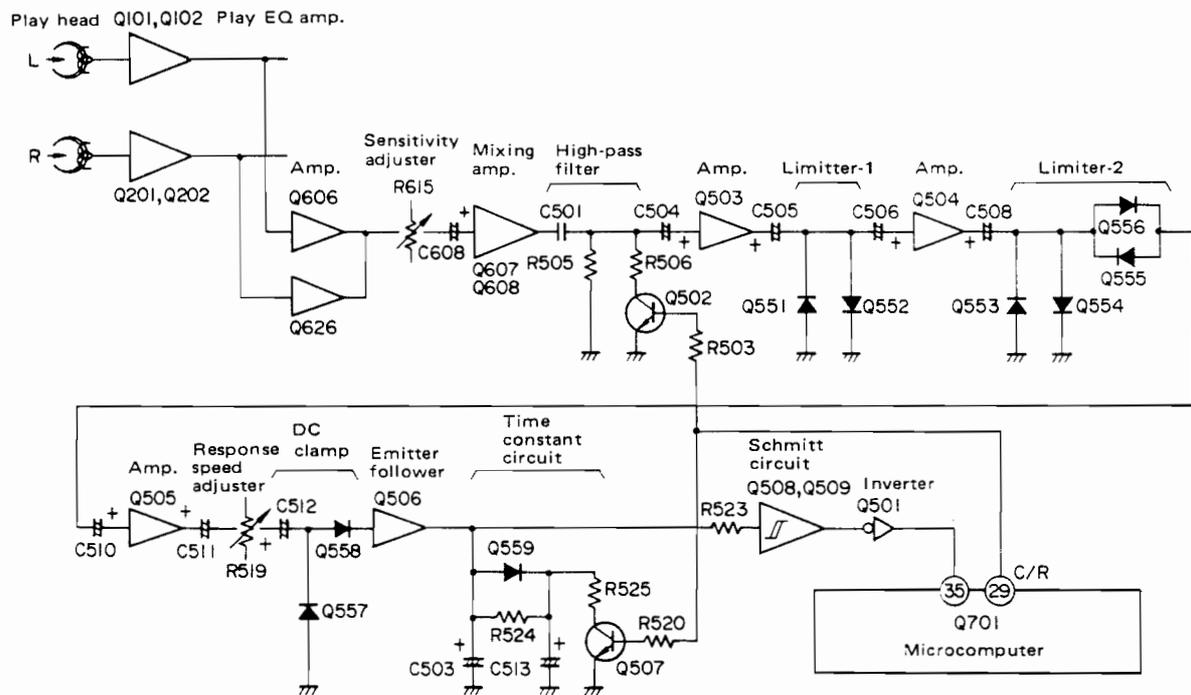

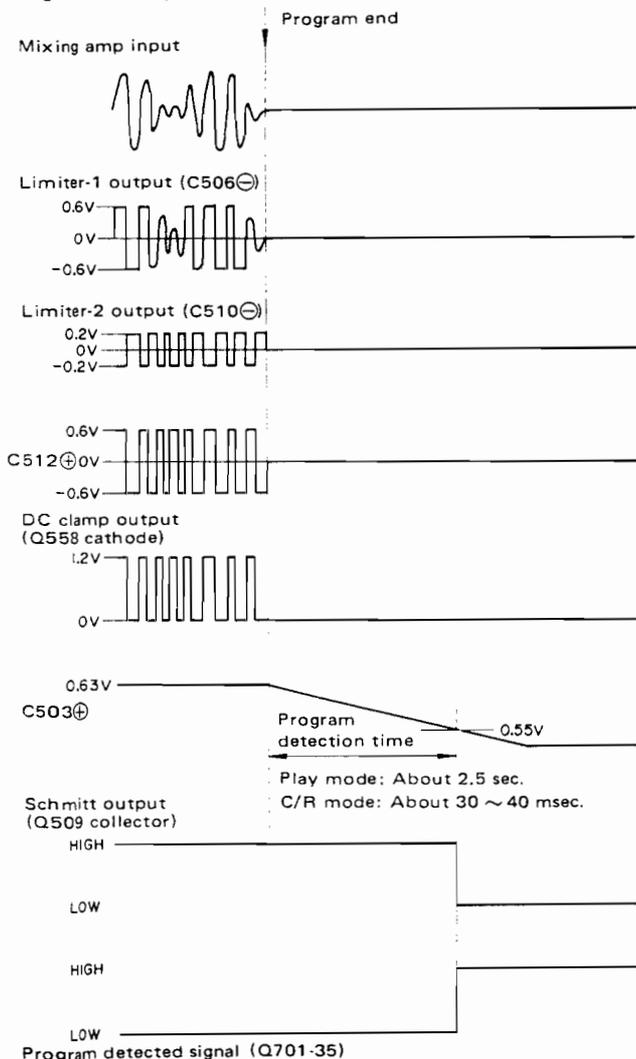

Fig. 3-10 Program detector circuit block diagram

Fig. 3-11 Program detected signal

The program detector circuit detects blank spaces between programs on tape and feeds a high level program control signal to pin 35 of the microcomputer. Fig. 3.10 is a block diagram of the circuit and Fig. 3.11 shows the waveform at each point.

- The play signals from the play EQ amplifiers of the left and right channels are amplified and mixed by Q606 and Q626.
- The mixed signal is further amplified by Q503 via the sensitivity adjuster and the high-pass filter.
- The high-pass filter turns on and off Q502 to change the cut-off frequency. In the CUE/REVIEW mode, the tape runs faster than in the PLAY mode and the play frequency band is shifted up so Q502 turns on. The cut-off frequency of the high-pass filter is shifted up by inserting R506 in parallel with R505. When the tape runs at a high speed as in the CUE/REVIEW Mode, the play signal level is increased. This signal is controlled when R506 is grounded by Q502 and the circuit impedance is reduced.
- The output signal from Q503 is fed to limiter-1 consisting of Q551 and Q552 to limit the maximum amplitude to about 0.6V.
- The output of limiter-1 is amplified by Q504 and is fed to limiter-2 consisting of Q553-Q556. Amplifier Q504 and limiter-2 amplify low level signals whose amplitude was not limited by limiter-1. When the signal is limited, the play signal is changed to a pulse signal. The amplitude of the output signal of limiter-2 is  $0V \pm 0.2V$ .

- f. This signal is amplified by Q505 and fed to the DC clamping circuit via the response speed control R519 to shift the input signal from R519, which is deflecting in both the positive and negative directions with respect to 0V, to the positive side without changing its amplitude.
- g. The DC shifted signal pulses pass through emitter follower Q506 to charge C503 and C513 in the time constant circuit.  
When recorded tape is being played back, charging pulses are continuously applied to C503.
- h. When the signal is present, the charging voltage at C503 is about 0.63V. Q508 and Q509 in the Schmitt circuit are ON and OFF, respectively; Q501 is ON while Q509 is OFF. Pin 35 of the microcomputer is at low level.
- i. When left and right channel play signals are not present, the pulses charging C503 stop so C503 discharges into the Schmitt circuit via R523.  
When the potential of C503 drops to about 0.55V, the Schmitt circuit is inverted and Q501 turns off. As a result, a "program detected" signal is applied to Pin 35 of the microcomputer.
- j. In the PLAY mode, the program detection time required to apply a detecting signal after the play signal stops is about 2.5 seconds (in other words, a blank space of about 3-5 seconds is required between programs).
- k. In the CUE/REVIEW mode, the tape runs at a high speed, so the program detecting time needs to be reduced. In this case, C507 is turned on to discharge C503 and C513 through R525 and Q507 so that a detecting time of about 30 mSec to 40 mSec is obtained.
- l. In the CUE/REVIEW mode, if the tape speed varied, the detecting time would vary, resulting in failure to detect programs.  
To prevent this, the reel motor is servo controlled to maintain a constant tape speed.
- m. Control R519 is used to adjust the amplitude of the pulses fed to the rectifier circuit. By changing the pulse amplitude, the charging voltage of the time constant circuit is varied together with the detecting time.
- n. Recorded signals of which level indicated with the peak level meter exceeds -35 dB are judged as program signal.  
The signal level can be adjusted with R615.

#### 4. Tape Operation

During programming operation, the mode of tape operation cannot be selected with the pushbuttons.

The following describes the functions of pushbuttons and related circuits. Unless it is stated otherwise, the deck is in the STOP mode before any pushbuttons are pressed.

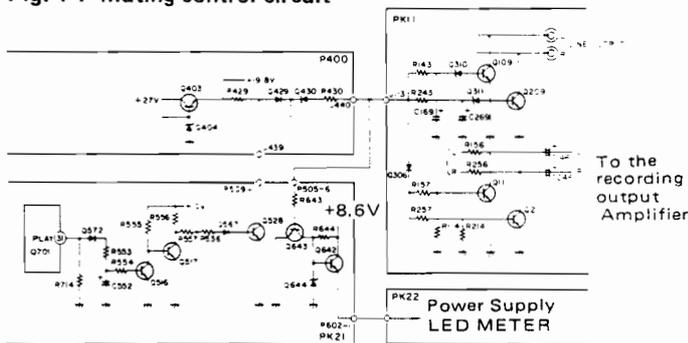

##### 4.1 PLAY mode

With the PLAY button pressed, circuit Q701 in the microcomputer is set to the PLAY mode and a high level PLAY signal is output from pin 31. This signal passes through Q572, R553 and R554 to turn on Q516.

At this time, Q517 is OFF and the signal at the collector is inverted from low to high level and the following operations are performed.

- (1) Q528 is switched ON via R557, R536 and Q536 and the amplifier is set to the PLAY mode (see Fig. 4.1) as follows.

Fig. 4-1 Muting control circuit

- a. Q643 is switched OFF and the voltage regulator circuit operates to supply power to the LED meter.
- b. Q109 and Q209 are switched OFF to release the muting function of the play output circuit.
- c. Q111 and Q211 are switched OFF to release the muting function of the recording output circuit.
- (2) Q534 is switched ON for about 0.5 sec via R557, C515 and Q569. In the circuits following Q534, the solenoid drive voltage is selected as described previously (Item 3.3).
- (3) Q523 and Q527 are switched ON via R557, Q568 and R596. The brake solenoid L002 is activated to release the braking of the reel disks.
- (4) Q522 and Q529 are switched ON via R557 and R563. PLAY LED Q591 lights and play solenoid L001 is activated to set the deck in the PLAY mode.

##### 4.2 REC/PLAY mode

The deck cannot be set to the REC/PLAY mode unless ANTI-REC switch S002 is open. Also, the deck cannot be set to this mode manually unless PROGRAM MODE switch S506 is in the OFF/CA position and COUNTER MEMORY switch S504 is in the OFF, REWIND/STOP or REWIND /REPLAY position.

- (1) By pressing the PLAY and REC buttons simultaneously, a high level play signal and recording signal are present at Pin 31 and Pin 32 of the microcomputer, respectively. The deck is set to the PLAY mode by the play signal.

The recording signal functions as follows:

- a. Q511 is switched ON via Q560, Q530 and R532. Q512 is OFF and Q513 and Q525 are ON.
- b. REC LED Q593 is lit by Q513.
- c. REC solenoid L004 is activated by Q525. REC/PLAY switches S101 and S102 in the amplifier are set to REC. The amplifier is set to the recording mode.
- (2) If, during the PLAY mode, the PLAY and REC buttons are pressed at the same time, the deck is also set to the REC/PLAY mode. In this case, the following operations are performed, as well as the operations given in a through c.
- d. Q512 is switched OFF and the signal at the collector become high level. This signal passes through R535, C514 and Q563 to activate the solenoid drive voltage selector circuit following Q534. Thus, the voltage of the REC solenoid is switched.

- (3) With REC/MUTE switch S502 pressed during the REC/PLAY mode, the recording amplifier is muted and hence the recording signal goes off. At this time, the display indicates second's digits automatically regardless of the position of the program setting switch. The display indicates 0-9 seconds repeatedly while S502 is pressed. As explained previously, a blank space of more than 3 seconds is required for proper operation of the program detection circuit, so that length of blank tape can be determined by the time indicated during the REC/MUTE operation.

#### 4.3 PAUSE mode

##### (1) PLAY/PAUSE

If the PAUSE button is pressed when the deck is in the STOP, FF or REW mode, the PAUSE signal is not output. By pressing the PAUSE button during the PLAY mode, the PLAY signal (Pin 31 of the micro-computer) becomes low level and the PAUSE signal (Pin 31) becomes high level. With this, the tape is set to the STOP mode and the amplifier is muted.

The high level PAUSE signal has the following functions:

- a. Q524 is switched ON via R541 and the PAUSE LED Q592 is lit.
- b. Q515 is switched ON via Q575 and R558, discharging C522.
- c. Q526 is switched ON via R542 (Q526 does not function at this time).
- d. Q530 and Q531 are switched ON via R548, Q599 and R692. CUE/REV solenoid L004 is activated by Q531 (in this case, the solenoid drive voltage selector circuit does not operate). The CUE/REV solenoid sets the head base between the STOP and PLAY positions. When the PLAY button is pressed in the PLAY/PAUSE mode, the PAUSE signal level becomes low and the PLAY signal level becomes high. The PAUSE signal goes off and then the PLAY signal comes on about 25 msec later. CUE/REV solenoid L003 is OFF and PLAY solenoid L001 is ON.

##### (2) REC/PAUSE

When the PAUSE button or the REC and PAUSE buttons are pressed in the REC/PLAY mode, the tape is set to the REC/PAUSE mode. In either the REC/PLAY or REC/PAUSE mode, the REC signal is output and the amplifier is set to the recording mode. Other functions are the same as in the PLAY/PAUSE mode.

#### 4.4 FF mode

When the FF button is pressed, FF and FAST signals are output from Pin 27 and Pin 26 of the microcomputer, respectively.

The FF signal has the following functions:

- a. Q549 is switched ON via R579. The slack tape removal circuit stops operating when Q549 is ON.
- b. The reel motor drive circuit is activated via R570. The FAST signal has the following functions:
- c. Q515 is switched ON via Q573 and R558 to disable the PLAY signal circuit.
- d. Q510 is switched ON VIA R531 to disable the REC signal circuit.
- e. Q534 is switched ON momentarily via R559, C516 and Q576 to operate the solenoid drive voltage selector circuit.
- f. Q523 and Q527 are switched ON via R559, Q571 and R596 to operate BRAKE solenoid L002.

#### 4.5 REW mode

When the REW button is pressed, the REW signal and FAST signal are output from Pin 28 and Pin 26 of the microcomputer, respectively. The functions of these signals are practically the same as in the FF mode.

#### 4.6 STOP mode

In any of the following cases, the deck is set to the STOP mode during any mode other than the program mode.

- a. When the STOP button is pressed.
- b. When the SENSOR STOP switch is pressed.
- c. When the tape reaches its end.
- d. When PROGRAM MODE switch S506 is set from the SINGLE position to the OFF/CA position.
- e. When the COUNTER MEMORY switch S504 is set from the PLAY/STOP position to the OFF position with the PROGRAM MODE switch in the OFF/CA position.

During the program mode operation, the SENSOR STOP switch does not function. When unloading the cassette, the program mode operation is stopped and the tape deck is set to the STOP mode. The program mode operation stops by the procedures given in the above items d and e.

#### 4.7 Mode transfer

When the mode of operation is transferred from A to B, the signal in Q701 goes off and then the B signal is output on about 25 to 30 msec later. The tape deck is in the STOP mode until the B signal is output.

When the mode of operation is changed, the tape stops once and then starts again.

#### 4.8 Functions of operation buttons

When more than one operation button are pressed, the priority of the mode is determined by the microcomputer. Except when the PLAY and PAUSE buttons are pressed, the tape mode is determined by the button which is released last. The relationship between the operation buttons and the modes of operation is as follows:

- a. STOP button and any one of REW, FF, PLAY, PAUSE and REC buttons . . . STOP mode.
- b. REW button and FF button . . . STOP mode.
- c. REW (or FF) button and any one of PLAY, PAUSE and REC buttons . . . REW (or FF) mode.
- d. PLAY button and PAUSE button
  - (1) When the PLAY button is pressed first . . . PLAY mode (or the mode of the button released last).
  - (2) When the PAUSE button is pressed first . . . STOP mode (STOP mode when the PLAY button is released first, and PLAY mode when the PAUSE button is released first).

## 5. Programming

Fig. 2.4 shows the program signal input circuit. The switches in the matrix circuit, program memory and control signal output are controlled by the micro-computer.

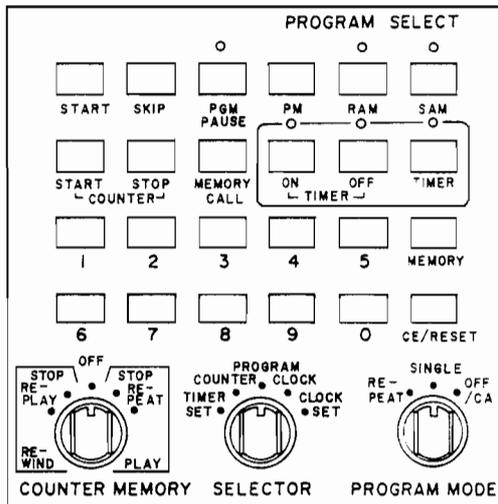

This section explains the operating conditions of the program setting switches and related functions.

The program setting switches have various functions, so special care should be taken when checking for circuit trouble or misoperation.

### 5.1 Matrix keys

Here, the functions of the program setting matrix keys are explained. For the functions of the 3 switches (COUNTER MEMORY, SELECTOR, PROGRAM MODE) at the lower part of the program setting unit, refer to Section 5-2 and succeeding sections.

Fig. 5-1 Program setting unit

#### (1) START

This is a program mode start command key. When the PROGRAM MODE switch is in the SINGLE or REPEAT position and the COUNTER MEMORY switch is in the PLAY/STOP or PLAY/REPEAT position, press the START key and the deck is set to the REW mode regardless of the position of the SELECTOR switch and the information stored in the memory.

#### (2) SKIP

This key is used to shift from one program to another during program mode operation. When the PROGRAM MODE switch is in the SINGLE position and the last designated program is being played back, pressing the SKIP key causes the tape deck to enter the STOP mode.

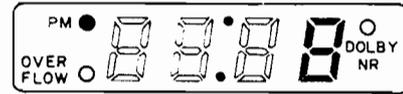

#### (3) PRG PAUSE

This is the PROGRAM PAUSE key. Press this key during the program mode operation and the tape stops briefly. To resume tape playback, press the same key again.

#### (4) PM

This key is used to indicate the PM (afternoon) sign on the display. It functions only when the SELECTOR switch is in the CLOCK SET position. By pressing the PM key, the display indicates as shown in Fig. 5.2.

Fig. 5-2 Indication when PM key is pressed

#### (5) RAM, SAM

These are RANDOM ACCESS MEMORY key and SEQUENTIAL ACCESS MEMORY key, and are used for memorizing, executing and reading programs.

When the RAM key is used, the programs are executed in the order in which they are arranged. When the SAM key is used, the programs are executed in numerical order. If the programs are arranged in the order of 4, 5, 3, 2 and 1, they are executed (readout) by the memory as shown in Table below.

Mode	Read-in	Read-out, Execution	
	Sequence	Mode	Sequence
RAM	4 - 5 - 3 - 2 - 1	RAM	4 - 5 - 3 - 2 - 1
		SAM	1 - 2 - 3 - 4 - 5
SAM	4 - 5 - 3 - 2 - 1	RAM	4 - 5 - 3 - 2 - 1
		SAM	1 - 2 - 3 - 4 - 5

The LEDs on the RAM and SAM keys indicate the memory being executed. They will light with the PROGRAM MODE switch in the SINGLE or REPEAT position.

#### (6) COUNTER/START, STOP

This is used to set the start and stop positions for counter, memory and play operations (STOP, REPEAT).

### (7) MEMORY CALL

This is used to check the information stored in memory. It has no effect on the programs being executed and tape deck operation. To cancel memory call, press the MEMORY key. When the CE/RESET key is pressed while the memory is recalled by pressing the MEMORY CALL key, the information in the memory is reset and cleared.

#### a. Recalling the programs

The preset programs can be recalled when the SELECTOR switch is in the PROGRAM position and the PROGRAM MODE switch is in the SINGLE or REPEAT position. For example, if programs are preset in the RAM in the order of 4, 5, 3, 2 and 1 and the MEMORY CALL key is pressed, the memory is recalled and the display is as shown in the Table below. In this example, the indication is clear from the 6th position, indicating that all the programs have been executed. If no programs are stored in the memory, the indication goes off when the MEMORY CALL key is pressed.

Table 5-2 Program call and indication (example)

Memory call pressed	1st	2nd	3rd	4th	5th	6th	7th	8th	9th
Indication	04	05	03	02	01	Cleared	04	05	03

#### b. Recalling the counter memory

The information in the counter memory is recalled, with PROGRAM MODE . . . OFF/CA, SELECTOR . . . COUNTER, COUNTER MEMORY . . . PLAY/STOP or PLAY/REPEAT.

The start count and stop count informations are recalled and displayed alternately each time the MEMORY CALL key is pressed. When no information is stored in the memory, the display is "000".

#### c. Recalling the timer settings

The timer-on time and timer-off time are recalled and indicated alternately each time the MEMORY CALL key is pressed while the SELECTOR switch is in the TIMER SET position. The LEDs in the TIMER/ON and TIMER/OFF keys will light alternately to indicate which memory is recalled. If the POWER switch is OFF and the timer start is in the standby mode, the memory recall function is not done. If the TIMER switch (S503) position is changed when recalling timer-on or timer-off timer memory, the memory recall is reset and the actual time is indicated.

### (8) TIMER/ON, OFF, TIMER

These 3 keys are used to set the timer.

#### a. TIMER/ON

Press this key when setting the timer start time. The start time can be set only when the SELECTOR switch is in the TIMER SET position. When the time is set, the LED above the key will light.

#### b. TIMER/OFF

Press this key when setting the timer stop time. The stop time can be set only when the SELECTOR switch is in the TIMER SET position. When the time is set, the LED above the key will light.

#### c. TIMER

This key is used to start and stop the timer. Press the key and the LED above the key will light to indicate that the timer is started. If the TIMER/ON or TIMER/OFF key or both are set, the LED above each key will light. When the TIMER key is pressed again, the LED goes off and the execution command is cleared.

If the TIMER/ON or TIMER/OFF key is not set, the LED will not light when the TIMER key is pressed and the timer will not operate.

When either the TIMER/ON or TIMER/OFF key is set, the timer starts operating when the TIMER key is pressed regardless of the positions of the COUNTER MEMORY, selector and PROGRAM MODE switches, thus executing the timer operation. (Timer recording is not performed unless the COUNTER MEMORY is OFF and the PROGRAM MODE is OFF/CA.)

### (9) 1-0

These keys are used to set program number, timer and count signals.

a. For example the figures "4, 3, 2, 1" can be set by pressing the keys 4, 3, 2 and 1 in that order.

To set figures "5:30", press the keys 5, 3 and 0 in that order.

b. In setting the count or timer, a maximum of 4 figures can be keyed in. In setting the program number, a maximum of 2 figures. Excess key-in is refused by the microcomputer.

c. If two or more keys are pressed, only the figure designated by the key first pressed is input. No signals are input by other keys while one key is depressed. When the signal is input, the count, time and sequence are indicated in the display. When the figures indicated are stored in the memory of the microcomputer by pressing the MEMORY key, the setting is completed.

### (10) MEMORY

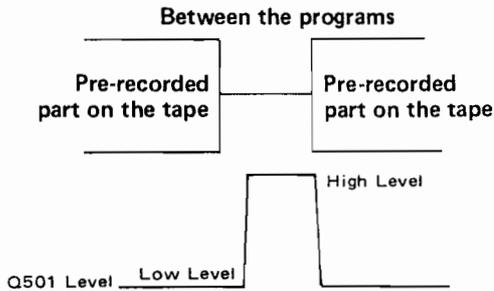

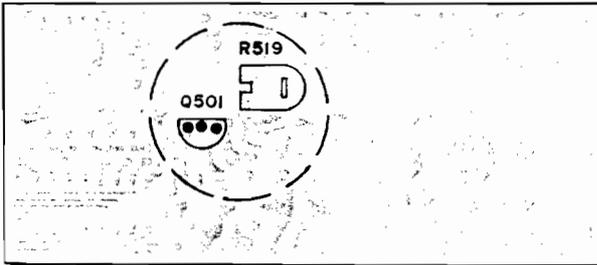

This key is used to store the figures preset in the display in the memory of the microcomputer. It is also used to reset in the memory recall operation.

**NOTE:** All the figures preset in the display may not be stored in the memory because of "error" or "overflow" (refer to section 5-3 "CLOCK SET, PROGRAM").

### (11) CE/RESET

This is the CLEAR ENTRY/RESET key. It is used to clear, indicate and reset the information stored in the memory. For details, refer to section 5-2 and subsequent sections.

PK11

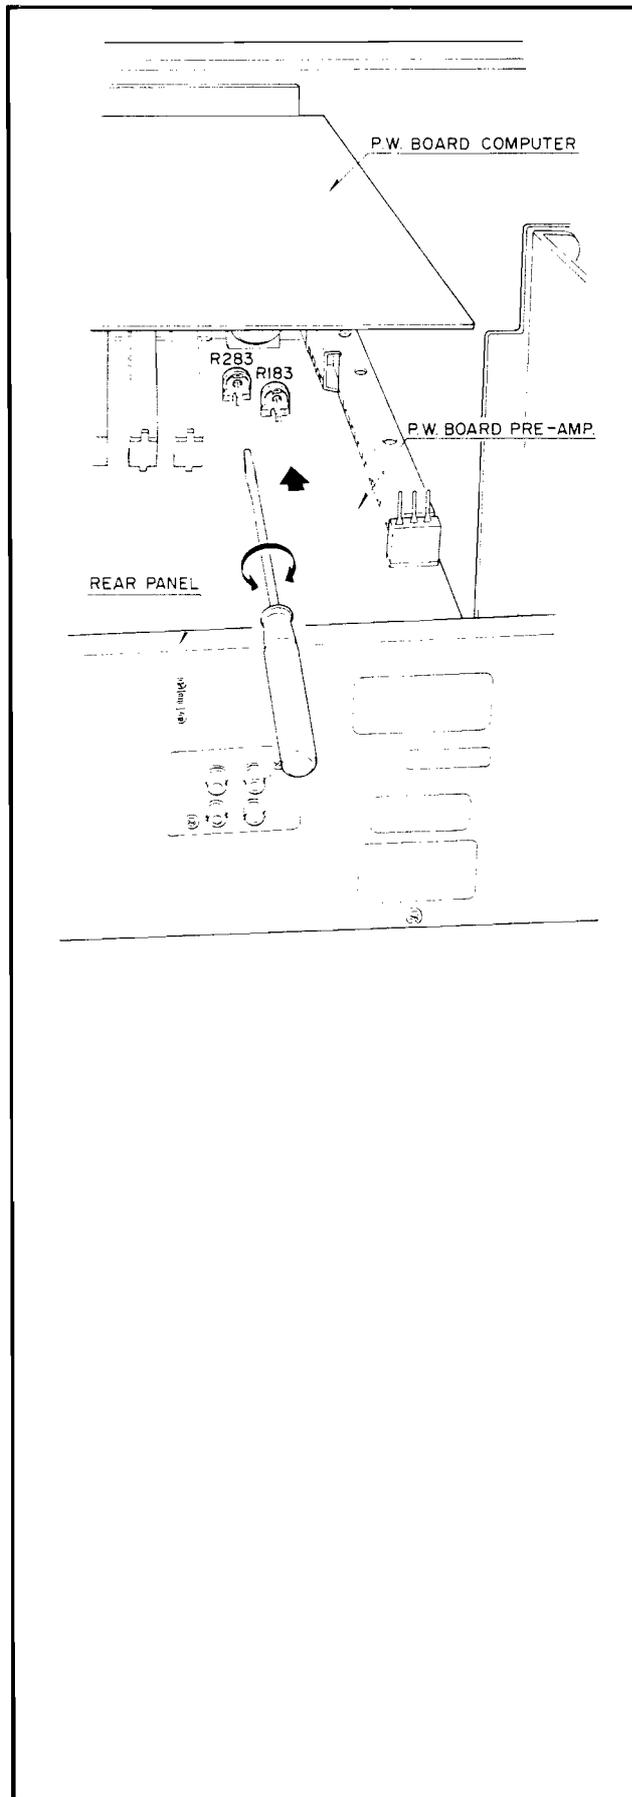

- \* Select the Play-Pause mode.  
At this time make sure that Q501's collector level becomes "High" for 2 to 3 seconds.
  - \* Next release Pause, and make sure that the collector level becomes "Low" in the recorded portion.
5. When in the Cue mode:
- \* Put the microcomputer in the Program Playback mode, such as Program Inputs 2 and 4, for example.
  - \* Input 2 and 4 and push the Start button.
  - \* The unit will Rewind and run the tape in the Cue mode for the first program.
  - \* Make sure that between the first and second programs Q501's collector level becomes "High".
  - \* If at this time the unit malfunctions, readjust R519. (Readjust so as to lower the overall level.)

**NOTE:** When R519 is readjusted, make sure performance in the Play mode is natural.

#### 14. Tape Slack Prevention Circuit Adjustments

- a. Set the mechanism operation button to STOP.
- b. Insert a torque cassette, or short-circuit J519 and J502. (By shorting circuit, the reels always rotate.)
- c. Adjust RM11 so that the torque becomes 35 to 50 g-cm.
- d. Remove the shorting wire after adjustment.

**NOTE:** This circuit functions only for a second or two after switching the power on. Therefore, the torque cassette procedure should be repeated several times to adjust to the specified torque.

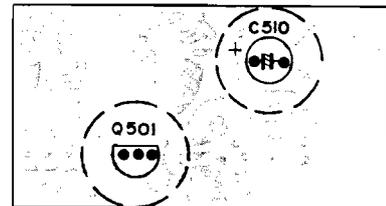

### 13. Program Selection by Inter-program gaps - Function Adjustments

#### SETUP

1. Tape speed selector switch: - NORMAL.
2. Tape selector:- Set to accommodate the music tape used.
2. Tapes to be used:- Should have large level differences between programs and inter-program gaps, and have around 4 second gaps between programs. Pre-recorded popular music tapes, for instance, are adequate.
3. Measurement terminals:- C510 negative side  
Q501 collector

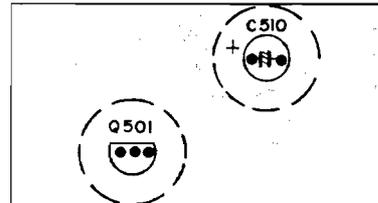

PK21

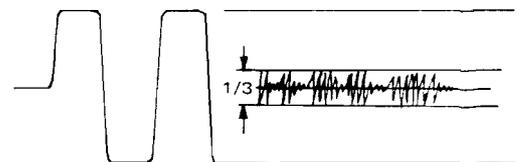

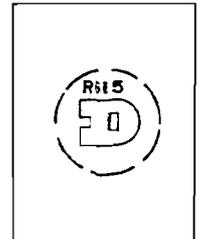

#### PROCEDURE

1. Connect the Ch. 1 probe of a synchroscope to the Q501 collector.
2. Connect the Ch. 2 probe of the synchroscope to the negative side of C510.
3. Adjust R615 to provide a ratio of 1/3 or less between the noise levels of recorded and non-recorded portions of the tape.

PK21

PK21

Recorded portion

Non-recorded portion

4. Next, adjust R519 as follows:

- \* Turn R519 to the extreme counterclockwise.
- \* Slowly turning R519 clockwise, watch Q501's collector waveform.
- \* Stop turning where, between programs, Q501's collector level becomes "Low".
- \* Turn clockwise further by approximately 10° beyond this position.

## 11. Bias Trap Adjustment

### SET UP

1. Power voltage:— 50 Hz/60 Hz AC voltage rated for the unit to be used in a market country.
2. Level control position:— VOLUME MAX.
3. Tape selector switch position:— METAL.

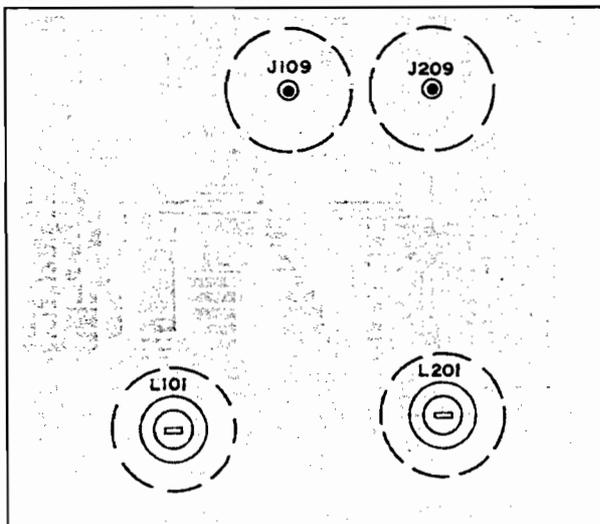

### PROCEDURES

1. Set up the unit in the recording mode of operation.
2. Connect the VTVM to J109 and J209 (L ch.) Adjust L101 and L201 (R ch.) for minimum VTVM read.

### CAUTIONS

1. If the leak bias is less than the specified value, the bias trap need not be adjusted since the adjusting coil is factory preset.
2. Tape adjusting rod used should be nonmetallic.

PK11

## 12. Phase Compensator Adjustment

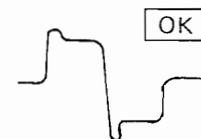

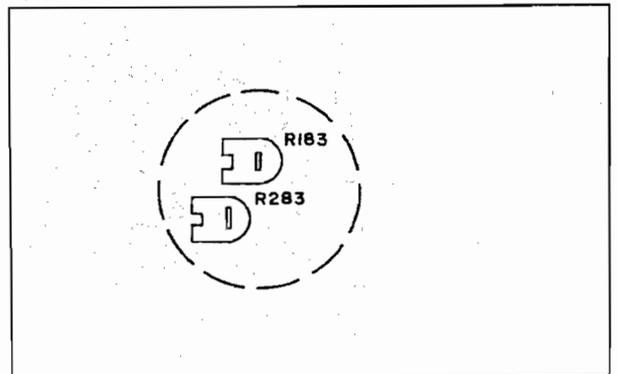

### SETUP

1. Power voltage:— 50/60 Hz
2. Input level:— 1 kHz, -60 dB (square wave)
3. Input terminal:— MIC
4. Tape speed selector switch: — HIGH
5. Dolby:— OFF
6. MPX:— OFF
7. Output:— Line Out (connect oscilloscope)

### PROCEDURE

1. Set the tape in recording mode.
2. Depress the pause button to set the tape in REC-PAUSE mode.
3. Adjust the MIC volume control until the LED meter indicates 0 VU.
4. Reduce the MIC input level by 10 dB (-70 dB).
5. Under this condition, release the REC-PAUSE mode and start recording. Play the recorded tape and adjust R183 and R283 until the waveform shown below is obtained. If required, repeat recording and playback.

PK11

X

**Record/Play Back Frequency Response Adjustment**

Tape	Standard		High	
	EQ	Bias	EQ	Bias
Normal	○	⊗	○	—
Fe Cr	fix	⊙	fix	—
CrO <sub>2</sub>	fix	⊙	fix	—
Metal	fix	⊙	fix	—

1. Columns marked ○, ⊗, and ⊙ include adjusting arrangement.
2. ○ Concerning fixed EQ columns, only Normal Tape is marked adjustable but if readjusted for Normal Tape, the other tape positions are also affected.
3. ⊗ includes trimming controls for both L ch. and R ch. (2).  
⊙ includes a trimming control common for L ch. and R ch. (1).

**10. 19 kHz Filter Adjustment**

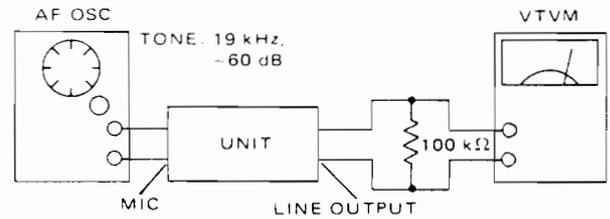

**SETUP**

1. Power voltage:— 50 Hz/60 Hz AC voltage rated for the unit to be used in a market country.
2. Input terminal:— 19 kHz, -60 dB.
3. Tape selector switch: — NORMAL.  
Output terminal:— Line out.
4. Load:— Measuring instrument input impedance.

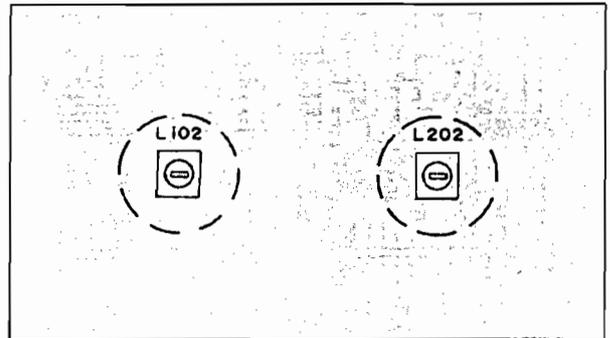

**PROCEDURES**

1. Connect the 19 kHz, -60 dB input signal to the Mic Input terminal. Adjust the level control for 0 VU.
2. In turn, MPX Filter switch to the ON position. Adjust the L102 and L202 for minimum output level at the Line Out.
3. Proceed both for the right and left channels in the same manner.

Mode: Record

PK11

## 8. Recording Equalizer Adjustment

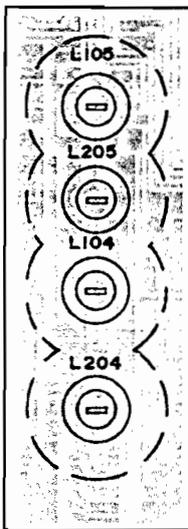

### SETUP

1. Power voltage:— 50 Hz/60 Hz AC voltage rated for the unit to be used in a market country.
2. Input level:— -20 dB lower than -60 dB.
3. Tape selector switch: — NORMAL.
4. Output terminal:— R101, R102.

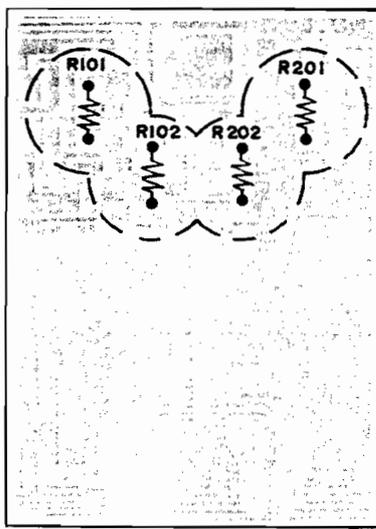

### PROCEDURES

1. Stop the recording bias current oscillator. Cutting out the bias circuit.
2. Set up the unit to the normal recording state. Reduce the input level by 20 dB.
3. Set the Tape selector switch to the Normal position. Set the audio-frequency oscillator to 15 kHz. Connect the VTVM R101, R202. Adjust L105 and L205 for maximum VTVM read. Tape speed selector switch — (Standard speed).
4. In turn, set the Tape selector switch to NORMAL position. Set the audio-frequency oscillator to 22 kHz. Connect the VTVM R101, R201. Adjust L104 and L204 for maximum VTVM read. Tape speed selector switch — (High speed).
5. After adjustment, release the recording bias.

PK11

PK11

### CAUTION

The adjusting rod should be non-metallic.

## 9. Record-Playback Frequency Response Adjustment

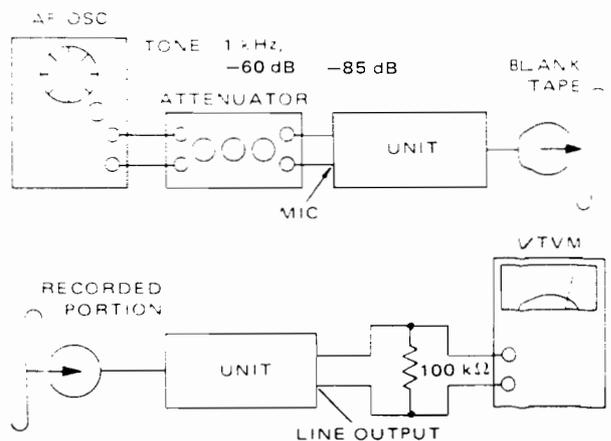

### SETUP

1. Power voltage:— 50 Hz/60 Hz AC voltage rated for the unit to be used in a market country.
2. Tape selector switch: — NORMAL.  
Tape speed selector switch: — STANDARD & HIGH.
3. Input signal:— 1 kHz, -60 dB with -25 dB referenced as 0 dB.
4. Output terminal:— Line out.
5. Load: Measuring instrument input impedance.
6. Playback output level:— Same as the recorded signal level.
7. Blank tape used:— AC-211, AC-511, CS-30 & AC-701.

### PROCEDURES

1. Connect the input signal to the MIC terminal. Set up the unit to the normal recording state.
2. In turn, reduce the input level by -25 dB with the use of the attenuator. Record the 1 kHz and 10 kHz tones.
3. Play the 1 kHz 25 dB down recorded tone back as 0 dB. Adjust the recording bias current until the 10 kHz response is within  $\pm 0.5$  dB as referenced to the 1 kHz, 0 dB response.
4. Follow similar sequence for the other Tape Selector switch positions (Fe-Cr, CrO<sub>2</sub>, and Metal) and adjust the bias current so the frequency response falls within the specified range.
5. When the tape speed is High, adjust Rec. EQ for all the Tape Selector switch positions to provide response within specifications.
6. Proceed both for the right and left channels in the same manner.
7. If the recording current is recorded reduced in the above adjustment, be sure to measure the distortion.

Mode: Record

X

### 6. Recording Current Adjustment

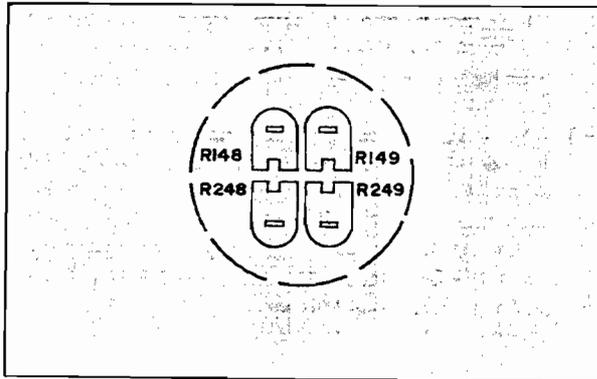

#### SETUP

1. Power voltage 50/60 Hz AC rated for the unit in the destination country.
2. Input signal:-1 kHz – 60 kB Mic Input
3. Output terminals:- LINE OUT
4. Tape selector switch position: - NORMAL, SPECIAL/CrO<sub>2</sub>, Fe-Cr, or Metal
5. Tape speed selector:- STANDARD or HIGH
6. Load:- Measuring instrument input impedance

#### PROCEDURE

1. In Rec mode, adjust the mic volume to 0 VU. Line Out output at this time is reference level 0 dB.
2. Adjust trimmers to provide a 0 dB output level when tape is recorded and played back.  
STANDARD speed R149 (L ch.) R249 (R ch.)  
HIGH speed R148 (L ch.) R248 (R ch.)

PK11

### 7. Recording Bias Current Adjustment (Temporal)

#### SETUP

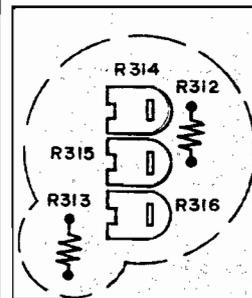

1. Power voltage:- 50 Hz/60 Hz AC voltage rated for the unit to be used in a market country.
2. Tape speed selector switch: – STANDARD.
3. Output terminal: – R101, R201
4. Load:- Measuring instrument input impedance.

#### PROCEDURES

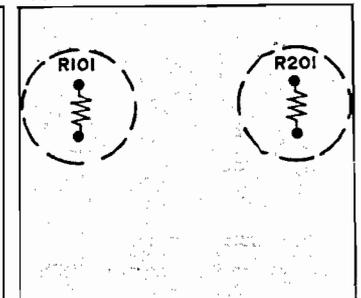

1. Select Rec-Pause mode.
2. Connect a VTVM across R101 (R201 for R ch.)
3. Adjust trimmers to provide the following indications on the VTVM:
  - (1) Tape Selector in NORMAL position: Adjust R410 (L ch.) and R411 (R ch.) to provide 400 mV. (P400)
  - (2) Tape Selector in SPECIAL/CrO<sub>2</sub> position: Adjust R315 (common for L and R) to provide 530 mV. (PK11)
  - (3) Tape Selector in Fe-Cr position: Adjust R316 (Common for L and R) to provide 420 mV. (PK11)
  - (4) Tape Selector in METAL position: Adjust R314 (common for L and R) to provide 700 mV. (PK11)

- NOTE:**
1. Adjust (1) NORMAL position first. If after adjusting other positions R410 or R411 are altered so readjust for all the other positions.
  2. The above adjustments are tentative. Finally, adjustments to provide Rec-Playback frequency characteristics falling within specified ranges are necessary.

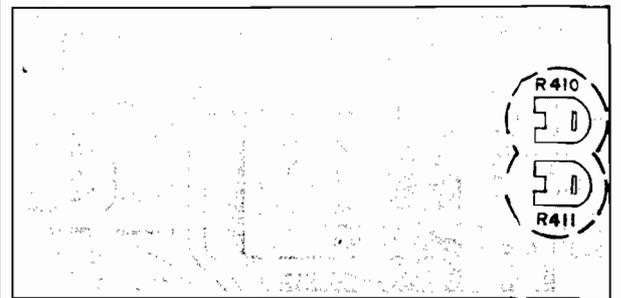

PK11

PK11

P400

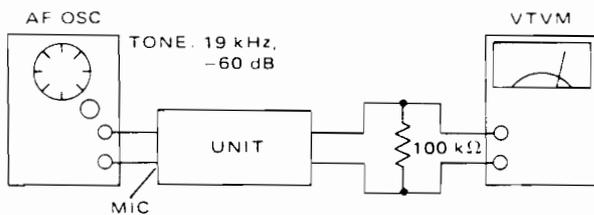

#### 4. LED Meter Adjustment

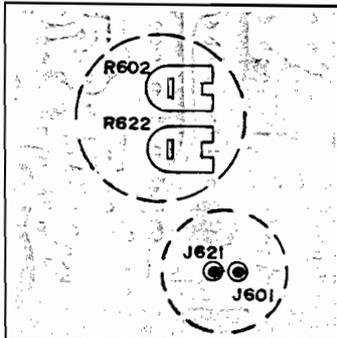

Tape Selector switch – NORMAL position.

##### PROCEDURES

1. Apply a 1 kHz –60 dB signal from the mic.
2. Select the Rec-Pause mode.
3. Adjust the mic volume to provide 3V DC at J601 (L ch.). (J621 for R ch.).
4. Adjust resistor trimmer R602 (R622 for R ch.) so that the "0" LED lights.
5. Adjust the mic volume to provide 580 mV (AC) at J111 (J210 for R ch.).
6. Adjust R610 resistor trimmer (R630 for R ch.) so that the "+2" LED lights.

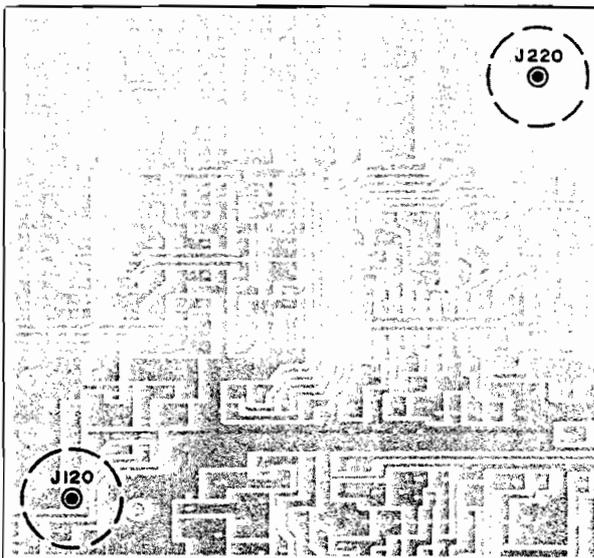

PK21

PK21

PK11

#### 5. Playback Output Adjustment

##### SETUP

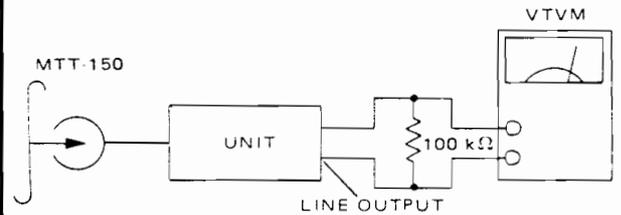

1. Power voltage:— 50 or 60 Hz AC voltage rated for the unit to be used in a market country.
2. Tape selector switch position: – NORMAL.
3. Load:— Measuring instrument input impedance.
4. Output terminal: – J111, J112
5. Test tape used:— MTT-150.
6. Tape speed selector switch: – STANDARD.

##### PROCEDURES

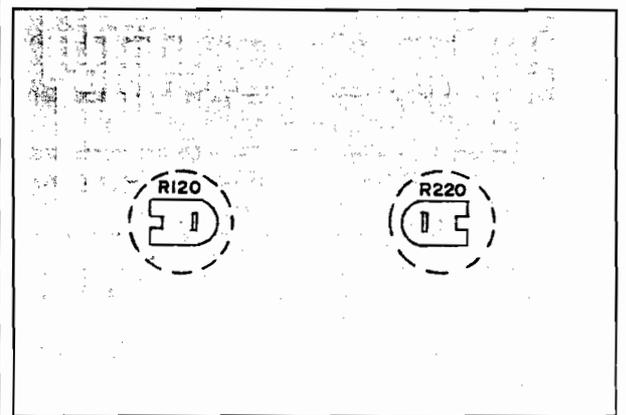

Play the test tape MTT-150 back. Adjust R120 and R220 (50 kΩ each) for 580 mV playback output level.

**NOTE:** Proceed both for the right and left channels in the same manner.

Mode: Playback

PK11

##### CAUTION

- This adjustment should be performed after the one for the playback equalizer. If the playback equalizer is adjusted after the playback output adjustment, the playback output should be readjusted.
- This adjustment should be performed after the one for the LED meter adjustment.

X

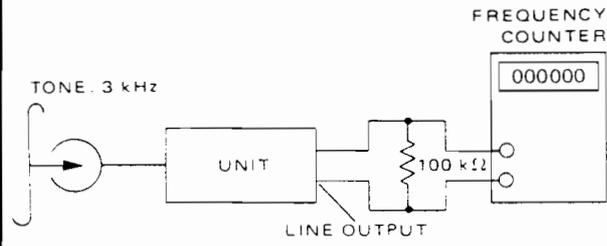

## 2. Tape Speed Adjustment

### SETUP

1. Power voltage:— 50 or 60 Hz AC voltage rated for the unit to be used in a market country.
2. Output terminal:— LINE OUTPUT (or DIN).
3. Test tape used:— MTT-111 (3 kHz Tone) at 1-7/8 IPS.  
MTT-111SP at 3-3/4 IPS.
4. Unit position:— Vertical.
5. Tape speed selector switch: — STANDARD or HIGH.

### PROCEDURES

1. For 1-7/8 ips, play the mid portion of the test tape MTT-111 back. Adjust the tape speed adjusting variable resistor inside the motor for 2990 to 3010 Hz counter indication.
2. For 3-3/4 ips, play the mid portion of the test tape MTT-111 back. Adjust R352 for 5990 to 6010 Hz counter indication.

### CAUTIONS

1. The tape deck should be set up in the normal operating condition.
2. Do not turn the variable resistor more than needed.
3. Do not proceed with adjustment after the tape deck temperature has changed.
4. If a strong shock or vibration is applied to the tape deck after adjustment, make certain that the measured tape speed had not changed.
5. If the tape speed deviation occurs, perform the adjustment again.
6. The counter may indicate a wrong value because of too low counter input level.
7. Before adjustment, allow for 30 seconds or more after depressing of the PLAY pushbutton.

**NOTE:** Be sure to carry out the 1-7/8 ips tape speed adjustment first.

## 3. Playback Equalizer Adjustment

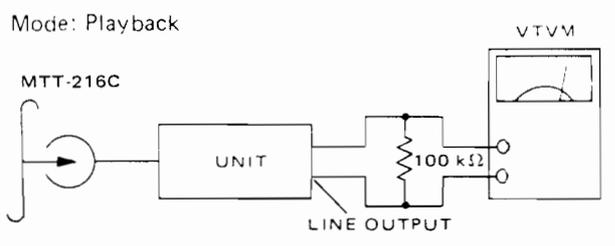

### SETUP

1. Power voltage:— 50 or 60 Hz AC voltage rated for the unit to be used in a market country.
2. TAPE SELECTOR switch position:— NORMAL.
3. Load:— Measuring instrument input impedance.
4. Output terminal:— LINE OUTPUT.
5. Test tape used:— MTT-216.
6. Tape speed selector switch: — STANDARD.

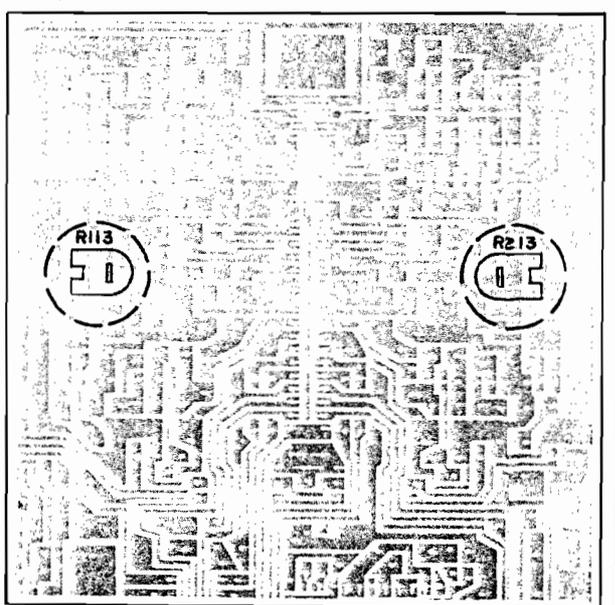

### PROCEDURES

1. Play the test tape MTT-216. Let the 315 Hz signal level be reference as 0 dB.
2. Adjust R113 and R213 (5 kΩ each) for 10 kHz frequency response of 0 to -1 dB in reference to the 315 Hz signal level.

- NOTE:**
1. Proceed both for the right and left channels in the same manner.
  2. Note that clockwise turning of R113 and R213 will increase the 10 kHz signal output level.

PK11

## 6. ELECTRICAL ADJUSTMENT

### Precautions before Adjustment

1. Before playing the test tape back, thoroughly demagnetize the heads, capstan and similar metal parts using an eraser as the test tape-recorded tone is easily erased.
2. Do not place the test tape on any measuring instrument.
3. Do not put the test tape near a place where the eraser is used.
4. Method of Demagnetization: — Turn the eraser power switch on at a remote position far away from the heads. Bring the eraser close to the heads, capstan and other parts to be demagnetized, and move it up and down four or five times to demagnetize. Slowly separate the eraser far away from the parts, and turn the power switch off.
5. Do not use any magnetized adjusting tool. When using it, demagnetize it from time to time in the course of each adjustment.
6. Do not turn semi-fixed resistor more than needed.
7. Do not apply locking bond excessively.

### Definitions

1. The "normal playback state" is an operating state of the tape deck which plays back the MTT-150 test tape and is adjusted so as to produce a 580 mV output at the LINE OUTPUT terminal with the load assuming the measuring instrument input impedance of greater than 100 k $\Omega$  and with the TAPE SELECTOR switch set at the NORMAL position.
2. The "normal recording state" is an operating state of the tape deck which records a 1 kHz signal to a specified recording level for which the recording level control is adjusted with the 1 kHz signal applied at a specified input level to the MIC terminal.  
In the normal recording state, therefore, this tape deck is set up with the level control to the state that the Peak Level Displays may illuminate to the 0 VU with a 1 kHz, 1 mV input signal applied.

### 1. Head Azimuth Adjustment

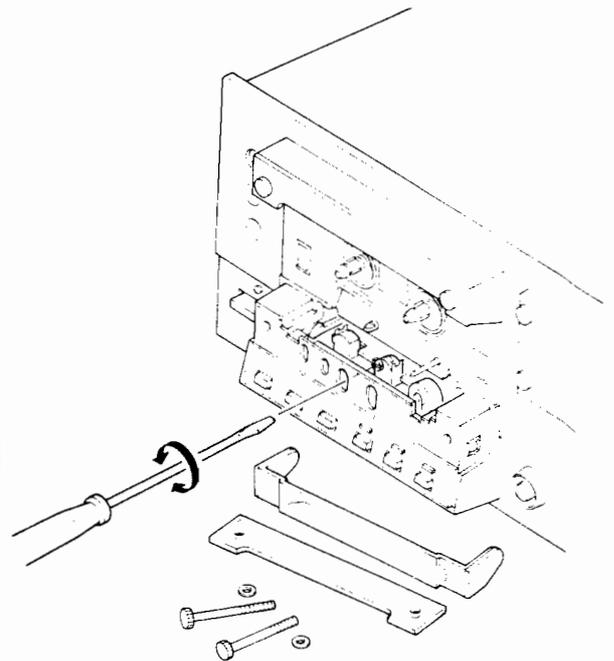

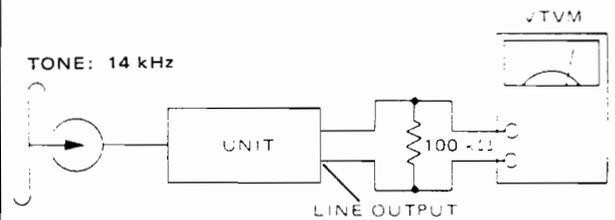

#### SETUP

1. Power voltage: — 50 or 60 Hz AC voltage rated for the unit to be used in a market country.
2. TAPE SELECTOR switch position: — NORMAL.
3. Load: — Measuring instrument input impedance.
4. Output terminal used: — LINE OUTPUT.
5. Test tape used: — MTT-216.
6. Tape speed selector switch: — STANDARD.

#### PROCEDURES

1. Play the 14 kHz portion of the test tape MTT-216 back. Adjust the head azimuth adjusting screw for maximum VTVM read.
2. If the peak output reads of the right and left channels are different, set the screws to obtain the mechanical center between the peaks.
3. After adjustment, lock the screw with bond.

Mode: Playback

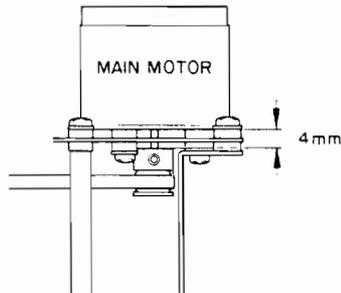

#### CAUTION

After adjustment, repeat the playback and stop setting a few times to make certain of no head azimuth deviation.

## 6. Motor Pulley Adjustments

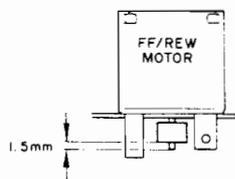

Loosen the set screw and adjust the motor pulley position until the clearance between the pulley and motor is 4 mm as shown. Tighten the set screw.

### \* Main Motor

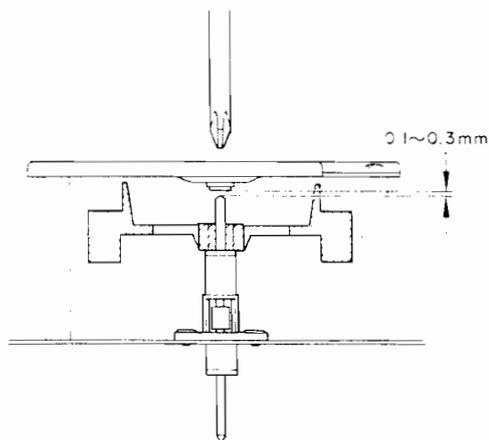

### \* FF/REW Motor

Insert the pulley so that the distance between the motor shaft and the pulley is 1.5 mm.

## 7. Flywheel Thrust

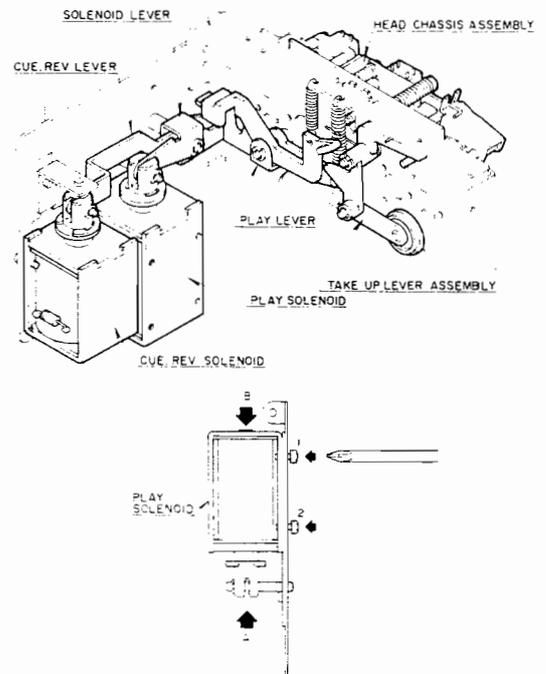

Adjust the thrust screw at the flywheel bracket until the clearance between the capstan tail end and thrust bearing is 0.1 to 0.3 mm as shown, using a Phillips screw driver. For adjusting, feel of axial dropping of the flywheel for proper clearance as this cannot be seen through. Then paint the screw to lock.

## 8. Solenoid Adjustments

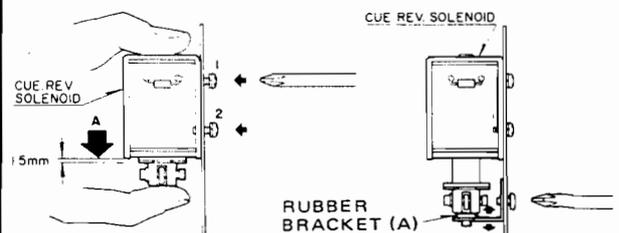

### \* Main Solenoid

1. Loosen the two Solenoid mounting screws.
2. Push the Solenoid plunger all the way with fingers in the direction of arrow (A). At this point, the head chassis should be in direct contact with the tape-up and supply reel sides.
3. Maintaining this condition, tighten Solenoid mounting screws, (1) and (2). At this time, push the Solenoid lightly to the plunger side in the direction of arrow(B).

### \* Cue/REW Solenoid

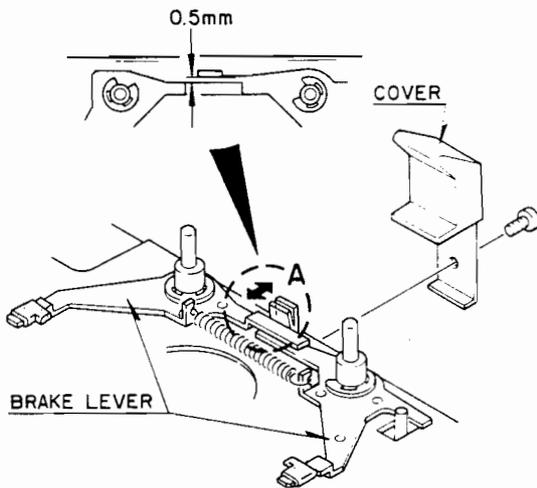

1. Move the head chassis by 1.5 mm from the extreme location where it was pushed.
2. Fasten the Solenoid in this new location. (However, the plunger should remain pushed as far in as possible.)
3. Fasten the mounting rubber bracket (A) so that the plunger touches the rubber when the head chassis moves back all the way.

## 5. MECHANICAL ADJUSTMENT

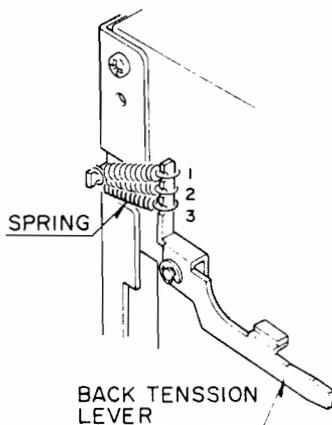

### 1. Brake Timing Adjustments

1. Remove the cover.
2. Adjust by bending portion (A) of the brake lever (076N) so that brake timings of the supply and take-up sides coincide with each other.
3. Set brake lever clearances to approximately 0.5 mm on both the supply and take-up sides.

### 2. Back Tension Adjustments

1. Alter the spring location, (1), (2), or (3), so that the back tension is between 3.5g and 6g.

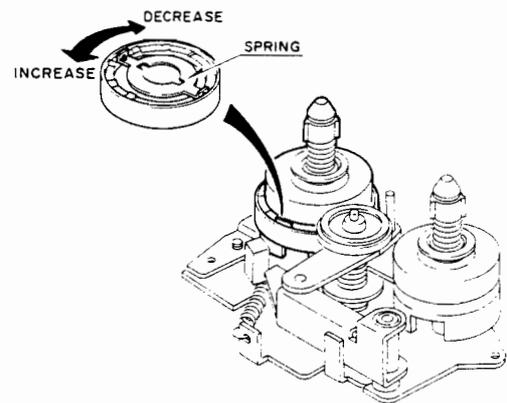

### 3. Play Torque Adjustment

Put the two pawls of the circular plate spring on proper stepped position of the reel rest. The adjustable torque range is 40 to 70 g-cm.

To make the torque high, put the pawls on a shallow step. For lower torque, put them on a deeper step.

Torque can be adjusted by shifting position of the spring P/N 4397115040.

The torque ranges from 40 to 70 g-cm.

### 4. FF and REW Torques are not Adjustable

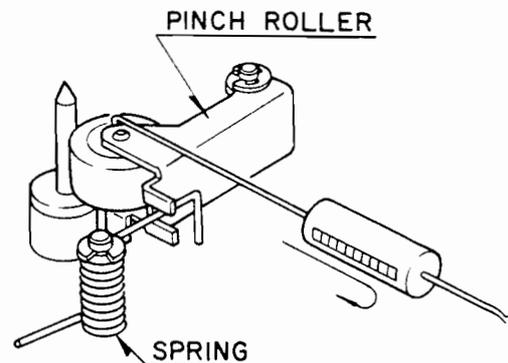

\* If FF or REW functions are inadequate, renew the entire block, P/N 4397002420.

\* When the motor (Reel motor M002) is worn, FF and REW modes may not function properly. In such a case, renew the motor.

### 5. Pinch Roller Pressure

$330g \pm 50g$

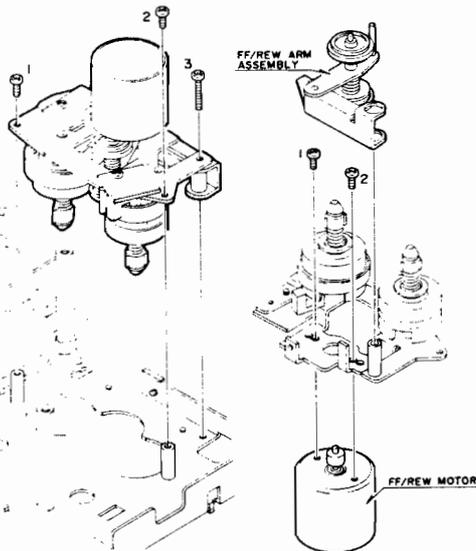

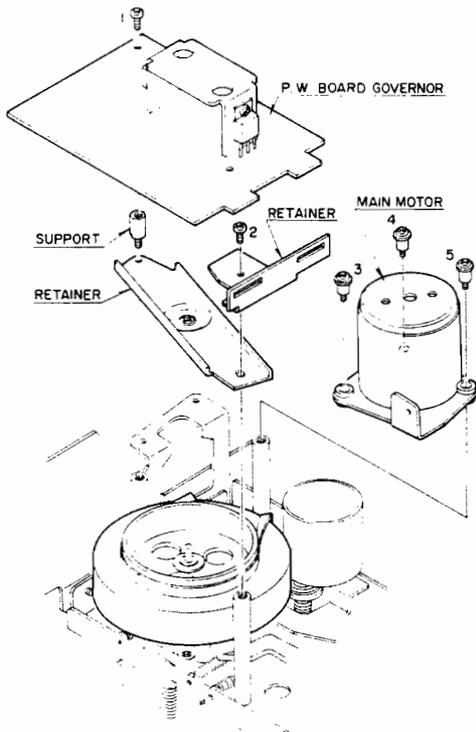

Measure the pressure of the pinch roller using a gauge as shown. For measurement, draw the pinch roller in the arrow direction in which it is detached from the capstan shaft and gradually return it toward the capstan. Read the gauge at the time when the pinch roller starts turning. The standard pressure is  $330g \pm 50g$ .

X

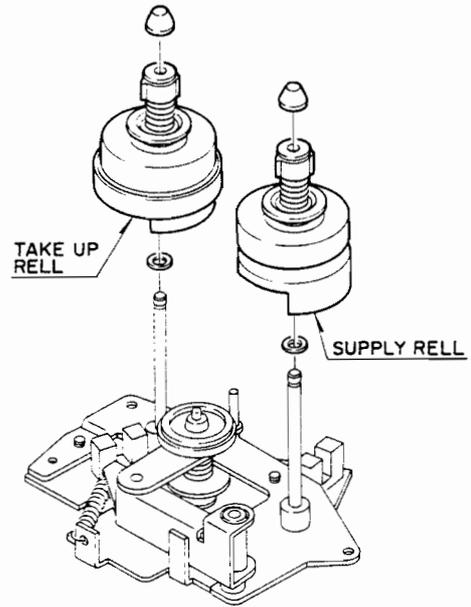

#### 4. Detaching the FF/REW Motor

1. Remove the mechanism block.
2. Remove the solenoid mounting bracket.
3. Remove the main motor mounting bracket.
4. Remove the flywheel (For flywheel detaching procedures, refer to paragraph 9 on Page 29).
5. Remove the 3 FF/REW motor mounting screws, (1), (2), and (3).
6. Remove the 2 mounting screws, (1) and (2), for the motor mounted on the motor mounting bracket.

#### 5. Detaching the Supply and Tape-up Real Disk

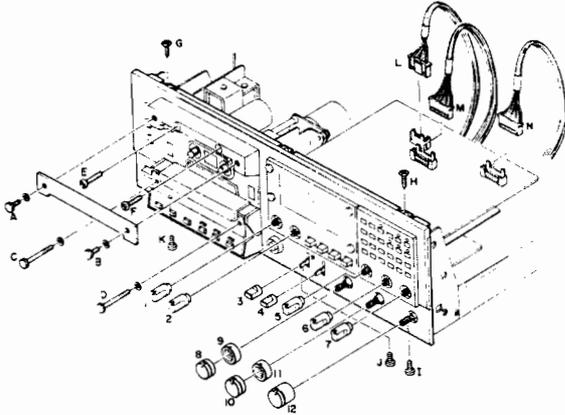

1. Remove the caps A holding the reel disks in place.
2. Release the brake lever and remove the reel disks.

## 4. DISASSEMBLE

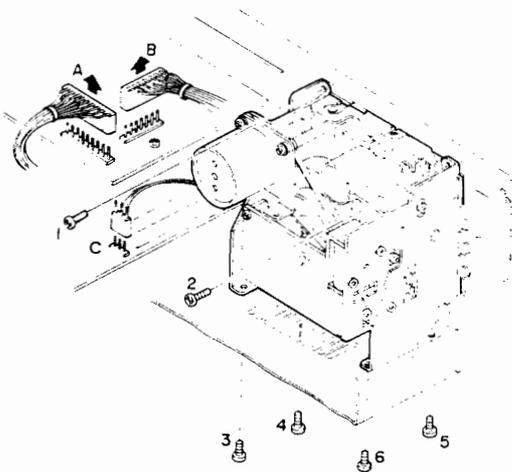

### 1. Removing the Front Panel

Remove the 12 knobs 1 ~ 11 and 12. Then, remove the 10 screws A, B, C, E, F, G, H, I, J and K. Then, remove the two connector L, M, N.

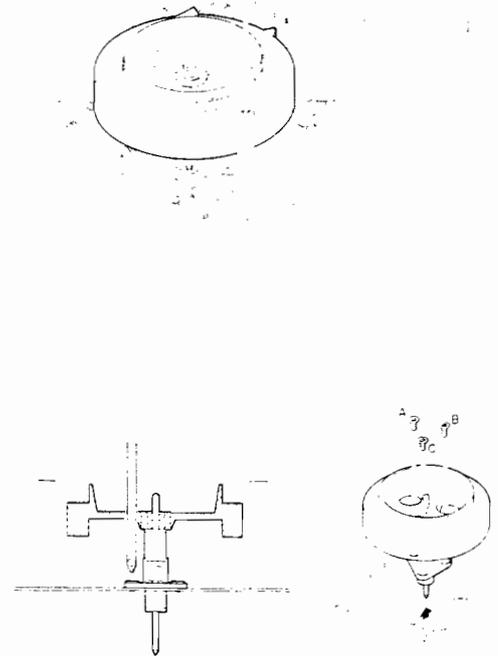

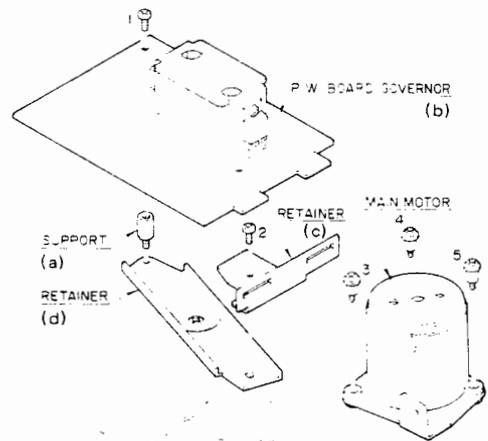

### 2. Removing the Mechanism Chassis

- 1) Remove the mechanism operating section housing. (Refer to detaching the front panel.)
- 2) Remove the 6 mechanism mounting screws.
- 3) Remove connectors (A), (B) and (C).

### 3. Detaching the Flywheel

1. Remove the single mounting screw (1) of the printed wiring board (b).
2. The printed wiring board can now be detached.
3. Remove the support (a) and the single attaching retainer (c) mounting screw (2).
4. The flywheel support retainer (d) can now be detached.
5. Remove the motor mounting bracket (3 screws).
- NOTE:** Take care to avoid oil getting on the motor belt.
6. Insert a screwdriver through the 3 holes in the flywheel.
7. Remove the 3 spindle bearing mounting screws (A), (B), (C).
8. The flywheel can be detached.

(5) Timer cycle OFF-ON

The tape deck starts operating at the time preset in the timer. This feature is used when using the deck as an alarm or for unattended tape recording. (In this case, the timer-off time should be cleared. When the memory is cleared, the display indicates 0:00. The timer-off function does not function at 0:00).

- a. When the POWER switch is OFF during timer ON stand-by: At the timer ON time, the power supply of the tape deck is turned on. The external devices are also supplied with AC power.
- b. When the POWER switch is ON during timer ON stand-by: AC power is supplied to the tape deck and the external devices.
- c. When the TIMER switch is in the REC position: At timer ON, the tape deck functions as follows (the parentheses indicate operation when the erasure prevention tabs have been removed from the cassette).

Condition 1:	REC/PLAY (PLAY)
Condition 2:	PLAY (Counter memory and program are not possible.)
Condition 3:	PLAY (PLAY Operations are not possible.)
Condition 4:	PLAY (PLAY) "

- d. When the TIMER switch is in the OFF position: The power is controlled by the TIMER ON signal.
- e. When the TIMER switch is in the PLAY position: At timer ON, the tape deck functions as follows.

Condition 1:	PLAY
Condition 2:	Counter memory play operation
Condition 3:	Program play operation
Condition 4:	Program play operation

(6) Timer cycle ON-OFF

Set the tape deck to the PLAY or REC/PLAY mode. The tape deck stops at the preset time. This feature is also used for sleep timer operation. At timer OFF, the tape deck stops. The tape deck also stops if the tape reaches its end before the timer OFF time. To turn off the AC power at the timer OFF time, proceed as follows:

- a. Turn the POWER switch ON.
- b. Store the timer OFF time, then press the TIMER key to start the timer.
- c. Set the deck to the REC/PLAY mode.
- d. At timer ON, the deck is set to the PLAY or REC/PLAY mode. Turn the POWER switch OFF.
- e. At timer OFF, the tape stops and, at the same time, the AC power to the tape deck and the external devices is turned off.

(7) Timer cycle OFF-ON-OFF

At timer ON, the tape deck is set to the PLAY or REC/PLAY mode; at the timer OFF, the tape deck stops. This feature is also used when using the deck as an alarm or for unattended tape recording. In this case, the timer OFF function is added to the timer cycle OFF-ON in the above item (5). The tape deck stops when the tape reaches its end before the timer OFF time.

If the POWER switch is OFF, the power remains on until the timer OFF time is reached even when the tape stops automatically at the end of the tape. Note that the timer OFF time should be set to a time later than the timer ON time.

(8) Timer cycle ON-OFF-ON

If the tape deck is in the PLAY or REC/PLAY mode, it will stop at the timer OFF time, and start again at the timer ON time. This feature is also used for sleep timer operation or when used as an alarm. The timer ON time should be set to a time later the timer OFF time. If it is not required to interlock the timer with the power supply, leave the POWER switch in the ON position with the tape deck started, then set the timer OFF and ON times so that the timer operation command is given by the TIMER key.

To interlock the timer with the power supply, use the following procedure:

- a. Turn the POWER switch ON.
- b. Store the timer ON and OFF times, then press the TIMER key.
- c. Set the tape in the PLAY or REC/PLAY mode.
- d. Turn the POWER switch OFF.

(9) Timer setting (special case)

When the hour display is other than 1 through 12, an error signal is generated as noted in section 5.3 "CLOCK SET".

However, the clock can be set to 0:00 only in the following cases.

- \* The power is connected to the tape deck and the CE/RESET key is pressed after the POWER switch is set to ON.
- \* At the CLOCK SET position of the SELECTOR switch, the CE/RESET key is pressed after the PM key has been pressed.

In either case, the clock starts operating when the CE/RESET key is pressed. Therefore, the timer ON and OFF times can be set using the time when the CE/RESET key is pressed as a reference. In this case, the setting time should be between 1:00 and 11:59, 12:00 PM and 11:59 PM, or 12:00 and 12:59.

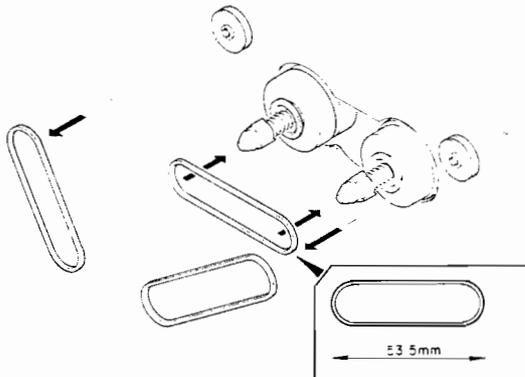

(10) Others

- a. When the time on the clock coincides with the timer ON or OFF time during timer operation, the TIMER ON signal is switched momentarily from low level to high level, or vice versa. For example, if 9:05 is stored in memory and the time on the clock advances to 9:05, the TIMER ON signal is given momentarily. In this case, the TIMER ON signal remains the same even if 9:05 is stored in memory when the clock indicates 9:05.
- b. When the tape deck is in the PLAY or REC/PLAY mode during timer operation, the operating mode remains unchanged even if the TIMER switch is set to another position.

**15. Adjustment of Reel Base Speed in FF/REW mode for Adjustment, Use a Digital Stroboscope**

1. a. Set the tape in FF mode.  
b. Adjust RM34 until the speed of the take-up reel base reaches 1070 rpm.
2. a. Adjust so that the speed of the take-up reel base is equal to the speed of the supply reel base.

Example 1: Use a rubber band as shown below.

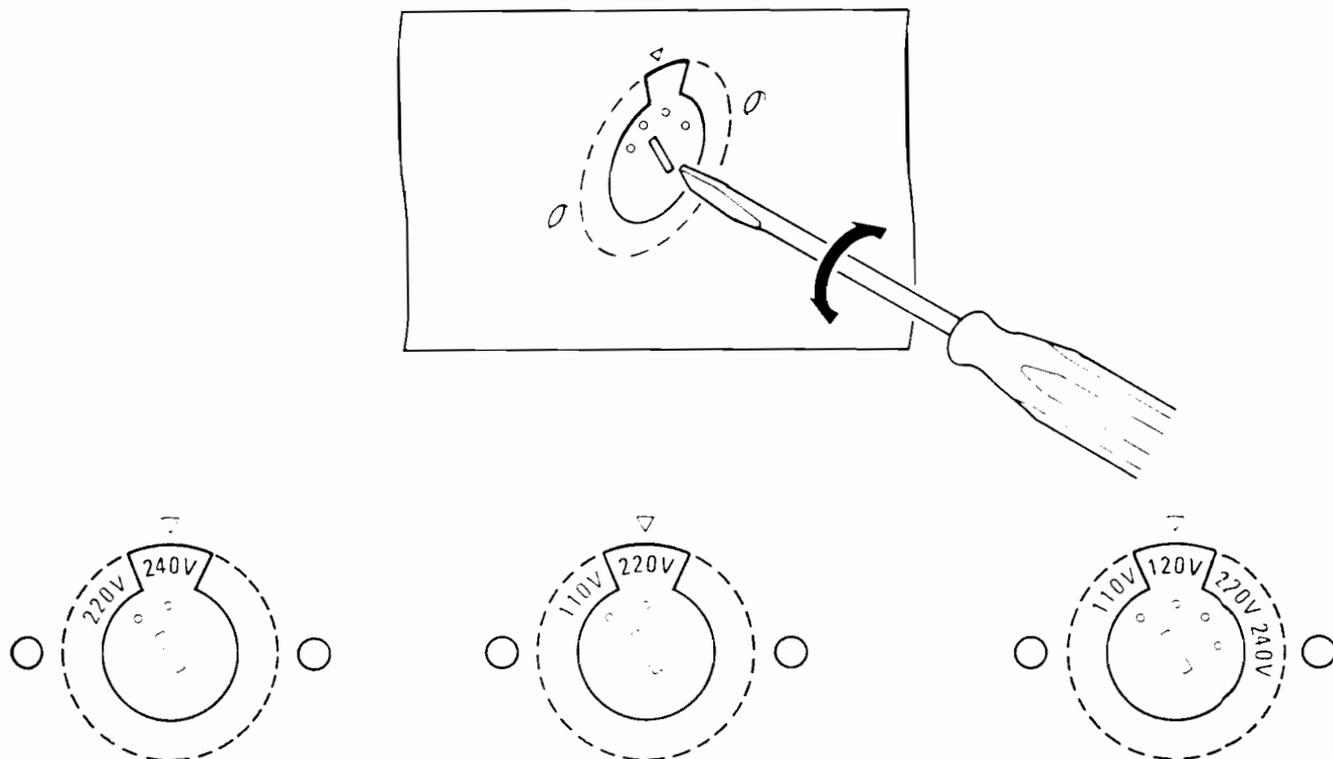

- 2: Engage the rubber band with the reel bases as shown in the illustration.
  - 3: Before engaging the rubber band, remove the mechanism case.
- b. Set the tape in FF mode.
  - c. Adjust RM48 until the speed of the tape-up reel base reaches 700 rpm.

## 7. VOLTAGE CONVERSION FOR EUROPEAN MODEL

To convert the unit to a different power source voltage, change the position as illustrated in the drawing below.

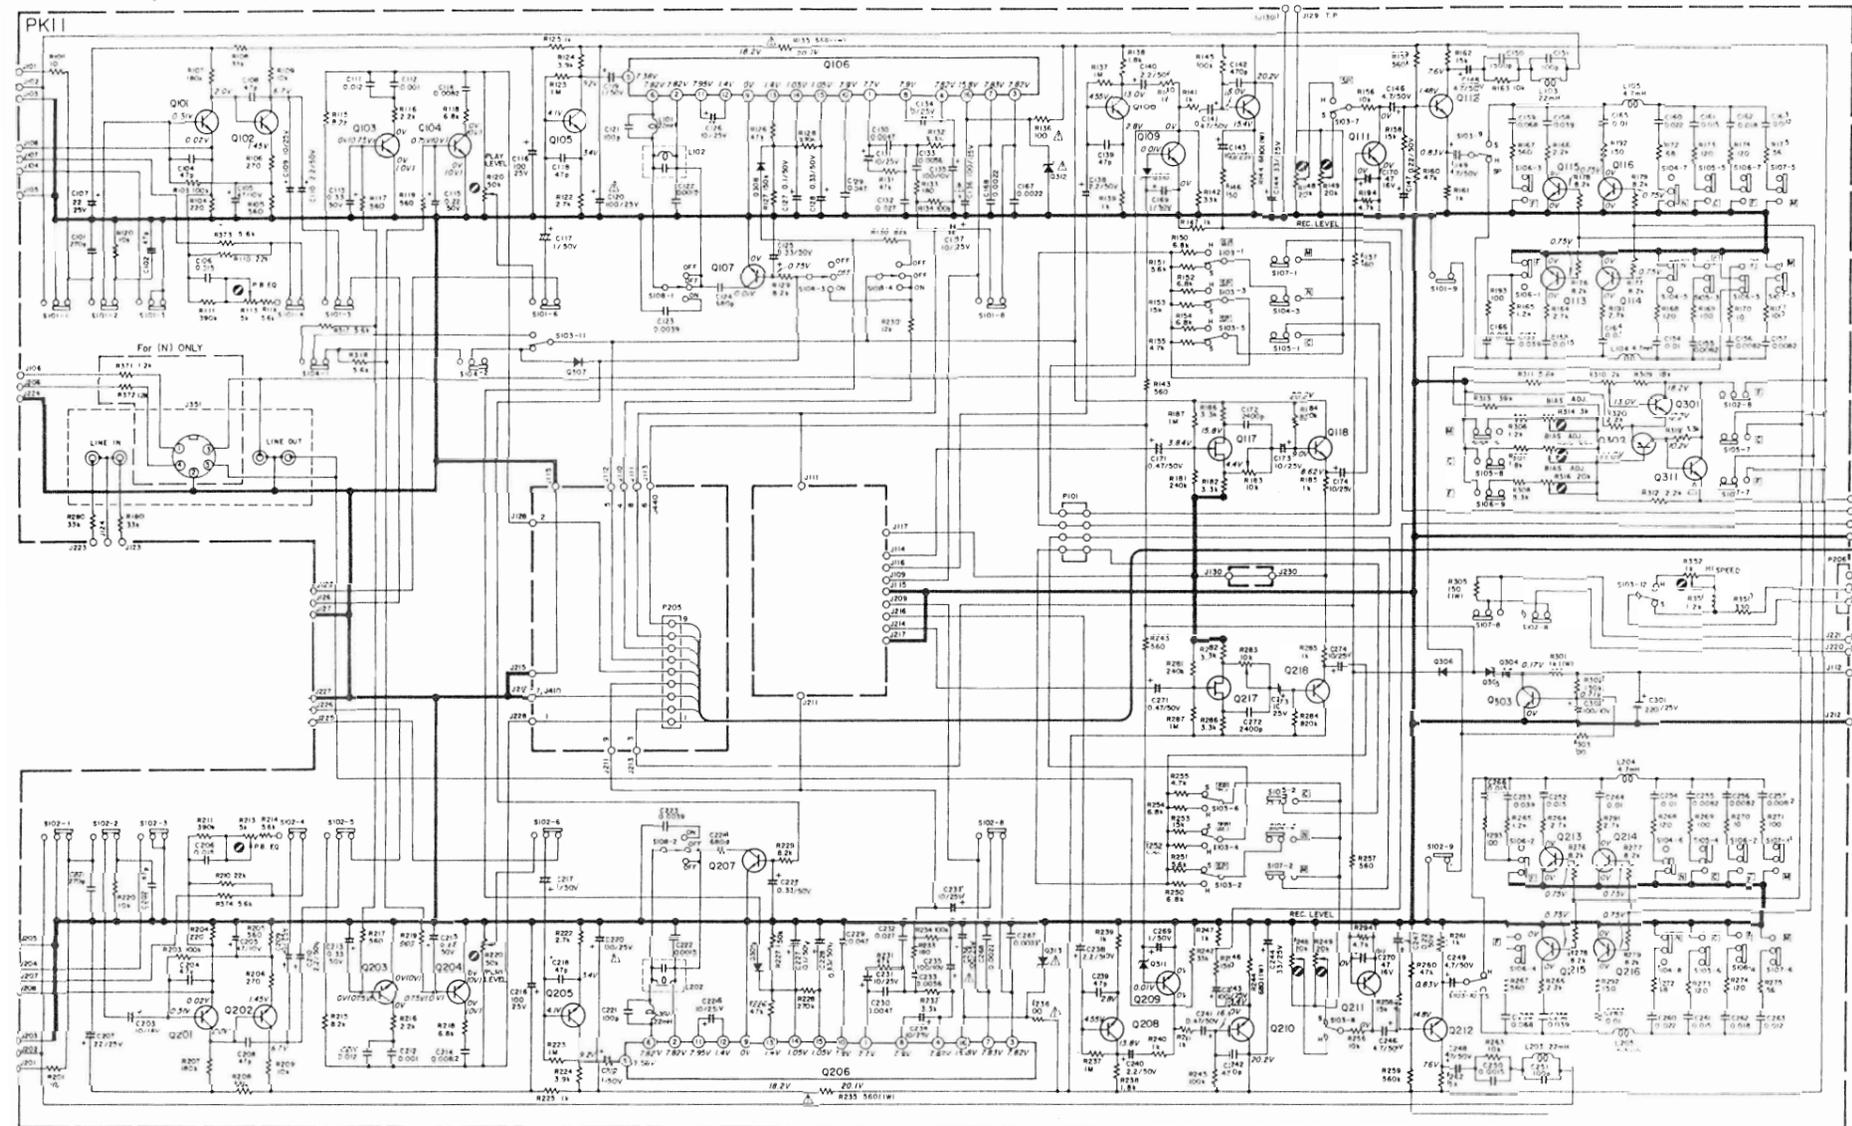

**CAUTION: DISCONNECT POWER SUPPLY CORD FROM AC OUTLET BEFORE CONVERTING VOLTAGE. DO NOT DISASSEMBLE THE VOLTAGE SELECTOR ABSOLUTELY.**

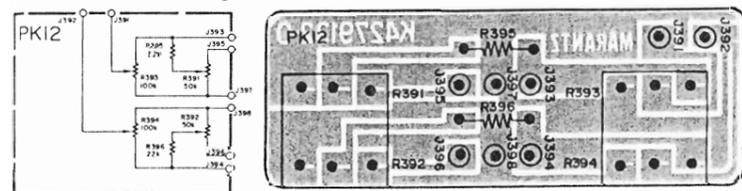

Note on safety: The parts marked with  are important parts on the safety. Please use the parts having the designated parts number without fail.

## 12. TECHNICAL SPECIFICATIONS

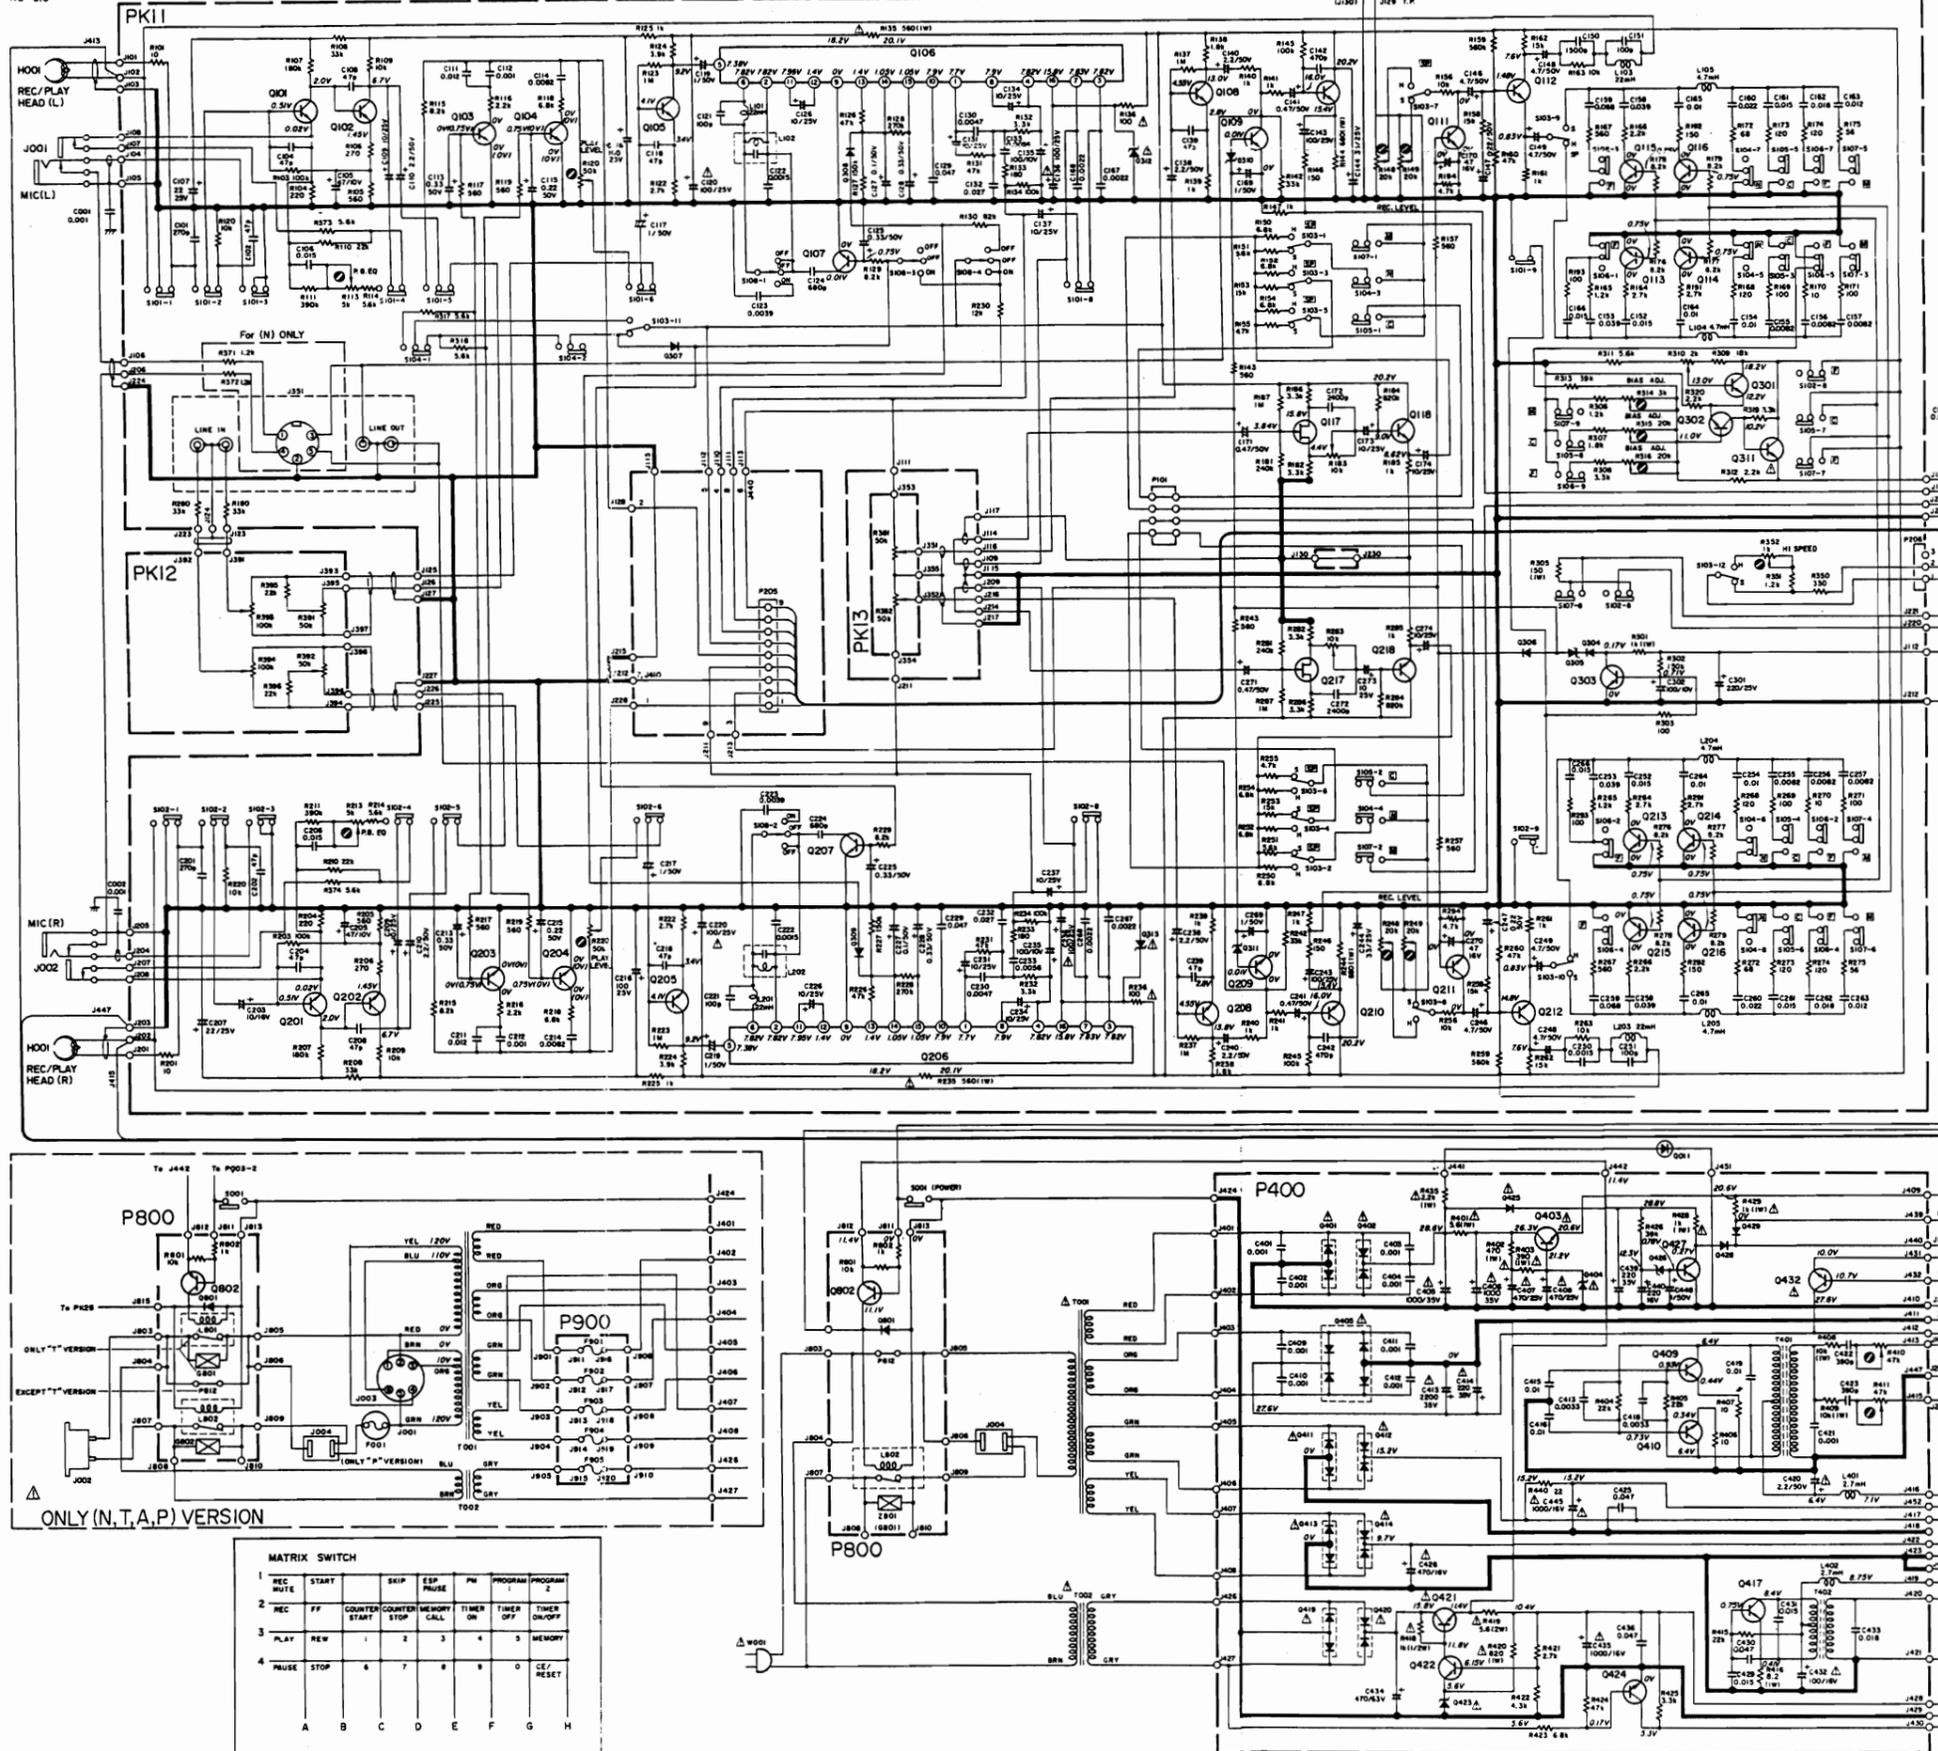

Type .....	Front loading 4-Track, 2-Channel Stereo Record/Playback System	
Tape .....	Phillips-type Compact Cassette	
Tape Speeds .....	High: 3-3/4 ips (9.52 cm/sec) Standard: 1-7/8 ips (4.76 cm/sec)	
Motor Drive System .....	DC Servo Motor (x2) with Single Capstan Drive	
Heads .....	2 Head System	
	Erase Head: Ferrite	
	Record/Play Head: Sendust Alloy	
Level Indicators .....	Left and Right LED Peak Level Displays	
Noise Reduction System .....	Dolby NR	
Semiconductors		
Transistors .....	91	
IC's .....	7	
Diodes .....	71	
LED's .....	18	
Wow and Flutter (WRMS) .....	High Speed	Standard Speed
	0.03%	0.05%
Frequency Response		
(Overall, -20 dB below 0 VU)		
Metal .....	25 Hz ~ 23 kHz (±3 dB)	25 Hz ~ 20 kHz (±3 dB)
Ferrichrome (FeCr) .....	25 Hz ~ 22 kHz (±3 dB)	25 Hz ~ 18 kHz (±3 dB)
Chromium Dioxide (CrO <sub>2</sub> ) .....	25 Hz ~ 22 kHz (±3 dB)	25 Hz ~ 17 kHz (±3 dB)
Ferric (Normal) .....	25 Hz ~ 20 kHz (±3 dB)	25 Hz ~ 16 kHz (±3 dB)
Signal-to-Noise Ratio		
Dolby ON .....	72 dB (over 5 kHz)	69 dB (over 5 kHz)
Dolby OFF .....	62 dB	59 dB
Outputs		
Line: Level .....	650 mV	
Impedance .....	1.2 kΩ	
Headphone: Level .....	43 mV	
Impedance .....	150 Ω	
Inputs (Level at 0 VU)		
Line: Sensitivity .....	-23 dBV (70 mV)	
Impedance .....	82 kΩ	
Mic: Sensitivity .....	-72 dBV (0.25 mV)	
Impedance .....	Low Z	
Fast Rewind Time .....	Approx. 85 sec. (C-60 cassette)	
Fast Forward Time .....	Approx. 85 sec. (C-60 cassette)	
Bias Frequency .....	100 kHz	
Power Requirements .....	120 V AC, 60 Hz	
Power Consumption .....	30 Watts	
Dimensions (W x H x D) .....	16-3/8 in. x 5-3/4 in. x 11-5/8 in.	
	(41.6 cm) x (14.6 cm) x (29.5 cm)	
Net Weight .....	22 lbs. 1 oz. (10 kg)	

### NOTES:

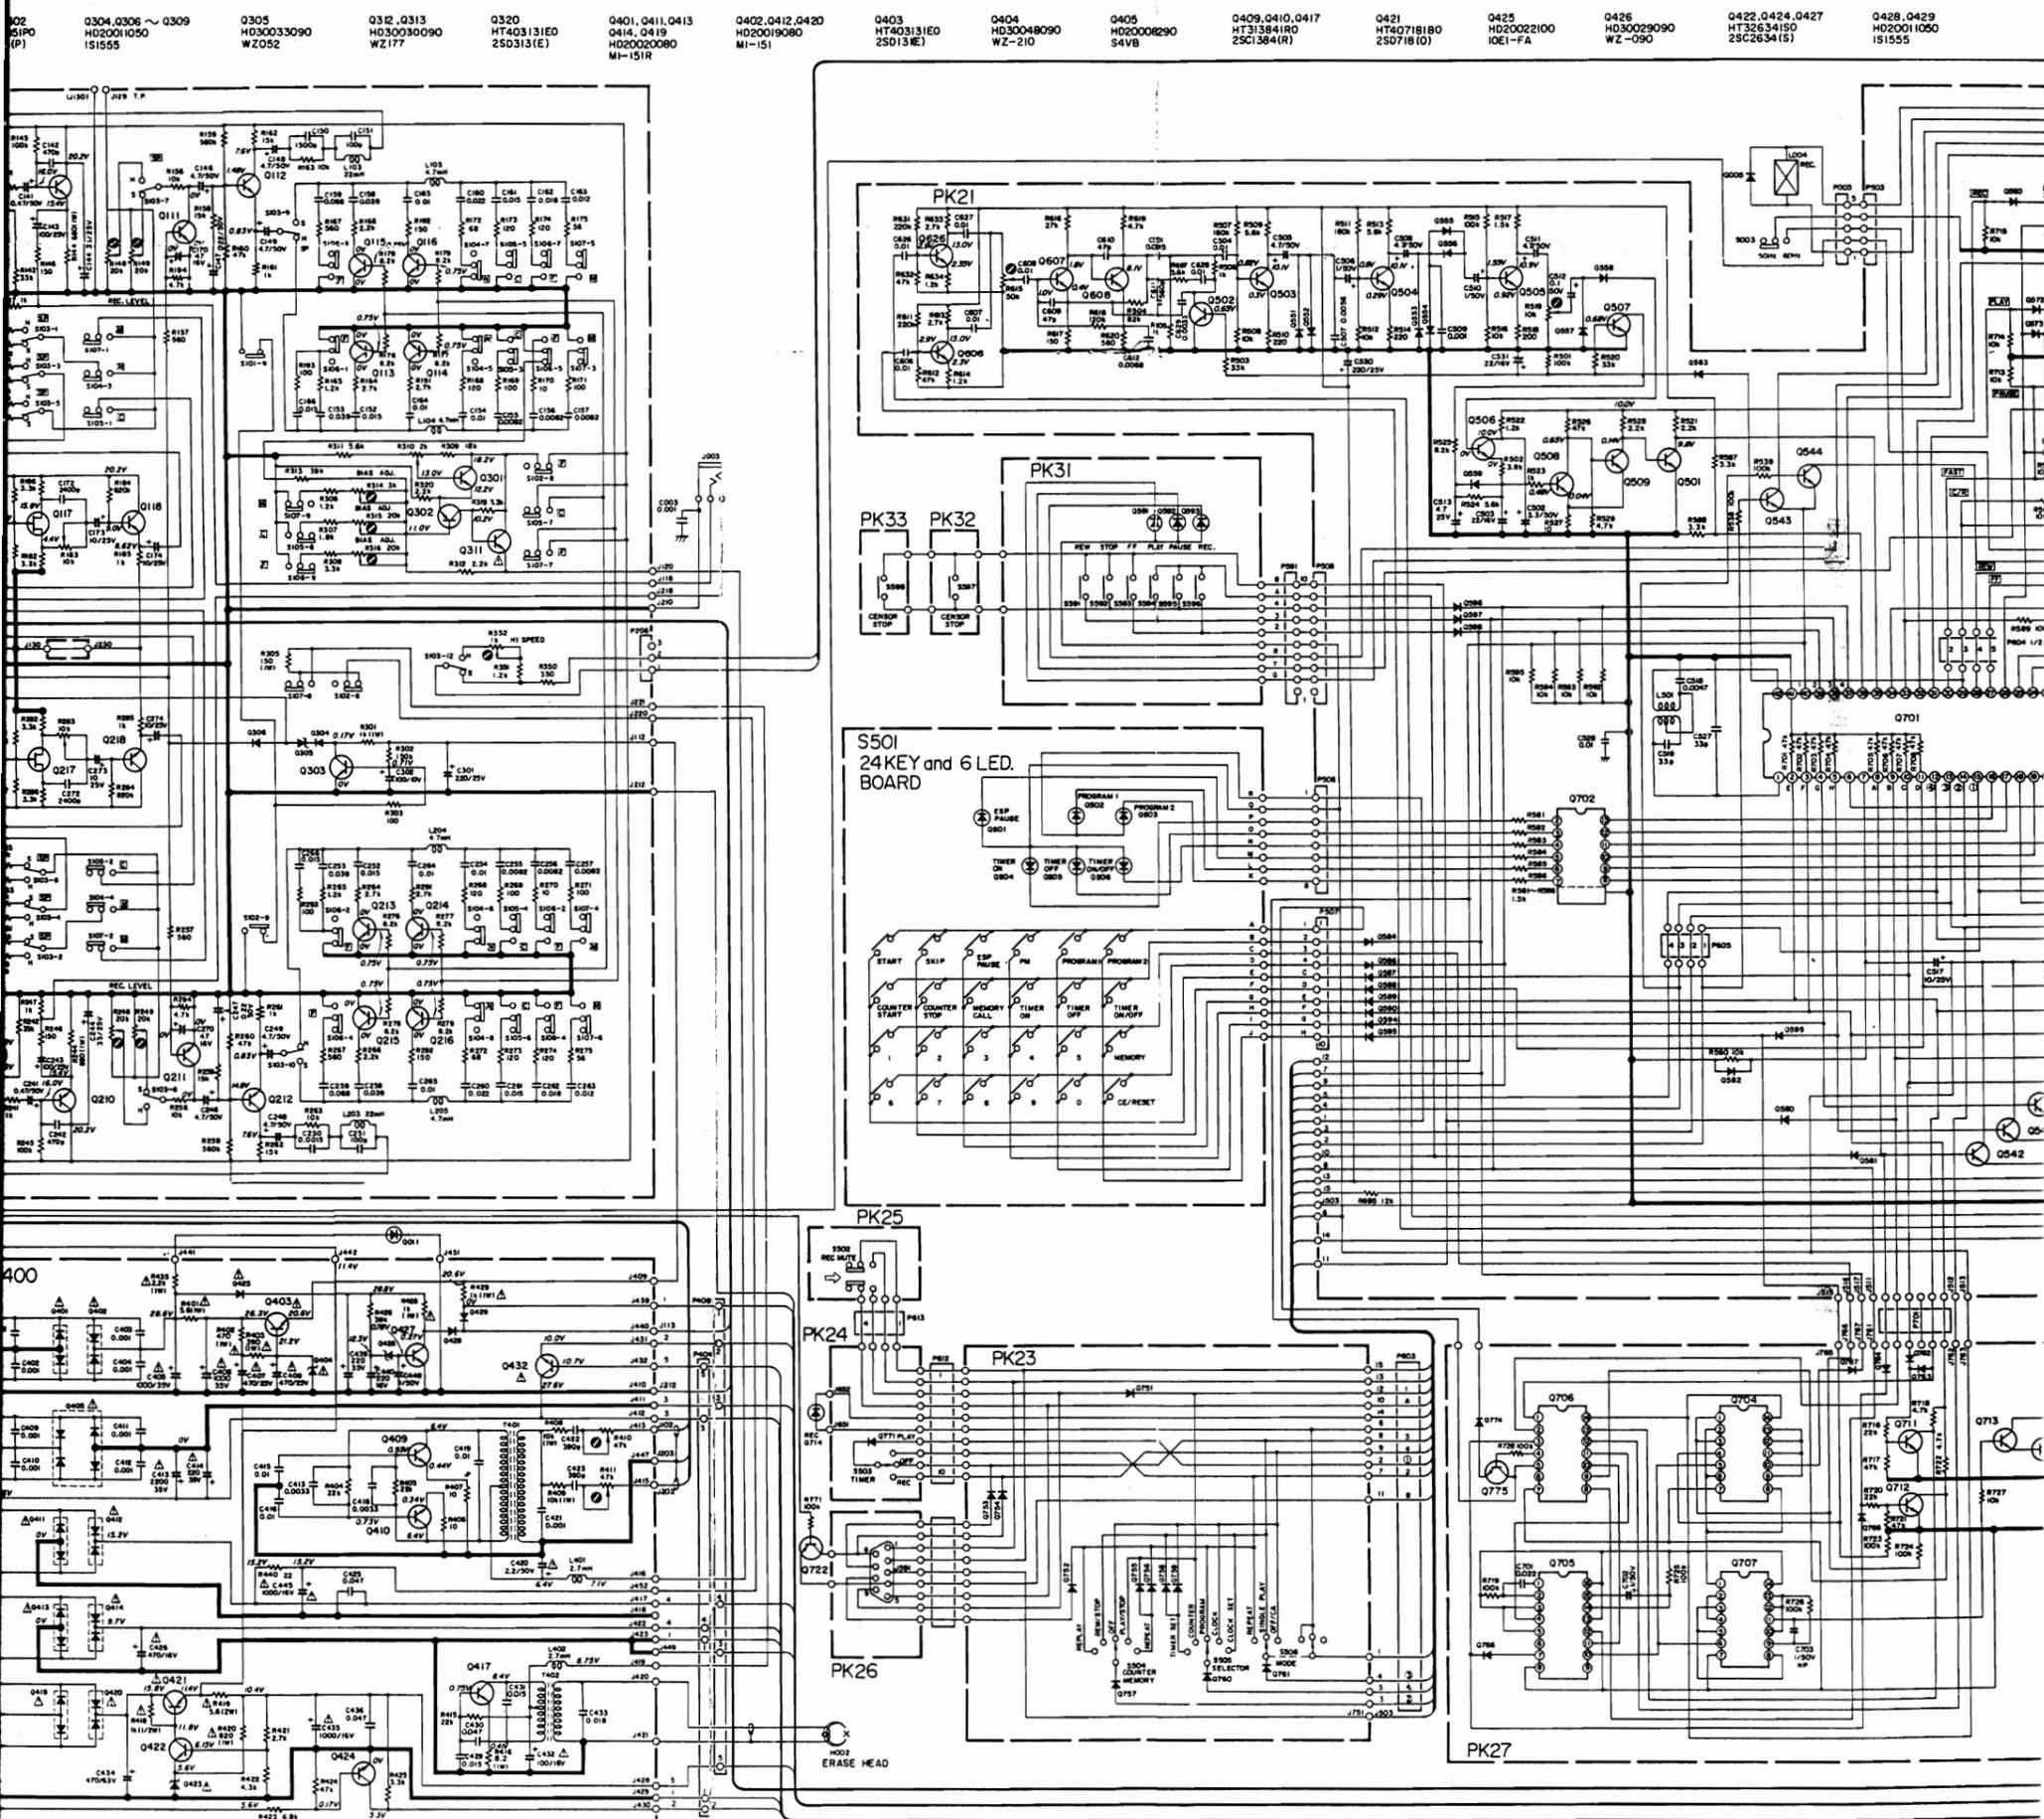

1. Reference recording level: 0 VU (160 nW/M)
2. Reference frequency: 315 Hz
3. Wow and flutter measured at: 3.0 kHz NAB WGTD RMS
4. Frequency response measured at: 20 dB below 0 VU recording level reference (Dolby off)
5. S/N ratio measured at the recorded level equivalent to 3% THD, IEC "A" WGTD, 70 μSec. EQ.
6. Recording reference tapes:
  - Normal: TDK AC 211
  - CrO<sub>2</sub>: TDK AC 511
  - FeCr: Sony CS 30
  - Metal: TDK AC-701

## MODEL SD 8000 TECHNICAL SPECIFICATIONS (DIN)

Style	Direct Load	
Tape Drive System	Single Capstan Drive	
Cartridge	Philips type compact cassette	
Track System	Compatible Stereo 4-track 2-channel	
Tape Speed	4.75 cm/sec. & 9.5 cm/sec.	
Heads	2 Head System	
Composition	Rec/Play: Sendust Alloy Erase: Ferrite	
Motor	DC Servo Controlled Motor x 2	
Meters	LED Peak x 2	
Recording System	AC Bias	
Erasing System	AC Erase	
Semiconductor Complement		
Transistors	91	
Diodes	71	
IC's	7	
LED's	8	
Overall Frequency Response (Dolby off):	<b>Tape Speed:</b>	<b>Tape Speed:</b>
Ferric Oxide Tape	<b>at 20 dB for 4.75 cm/sec.</b>	<b>at 10 dB for 9.5 cm/sec.</b>
CrO <sub>2</sub> Tape	25 Hz ~ 16 kHz (±3 dB)	25 Hz ~ 18.5 kHz (±3 dB)
Fe-Cr Tape	25 Hz ~ 17.5 kHz (±3 dB)	25 Hz ~ 19 kHz (±3 dB)
Metal Tape	25 Hz ~ 18 kHz (±3 dB)	25 Hz ~ 19.5 kHz (±3 dB)
	25 Hz ~ 18.5 kHz (±3 dB)	25 Hz ~ 20.5 kHz (±3 dB)
Total Harmonic Distortion		
Ferric Oxide Tape	2%	
CrO <sub>2</sub> Tape	2.5%	
Fe-Cr Tape	2.5%	
Metal	2.5%	
	<b>Tape Speed: 4.75 cm/sec.</b>	<b>Tape Speed: 9.5 cm/sec.</b>
Wow and Flutter (DIN WTD)	0.10%	0.07%
Fast Rewind Time	60 sec.	
Fast Forward Time	60 sec.	
AC Line Voltage	220 V AC, 50 Hz (E/N versions are featuring an external voltage selector for use on 110/220 V. T/A versions 220/240 V AC, 50/60 Hz.)	
Power Consumption	63 W	
Dimensions (W x H x D)	416 mm x 146 mm x 243 mm	
Weight	9.1 kg
