## 1.2. Voltage Selector

Voltage selector is installed on the rear panel for Other Version of the Nakamichi T-100. This voltage selector can select either 120 V or 220 - 240 V at customer's disposal.

## 1.3. Functions

T-100 contains 9 functions the details of which are as follows:

Figs. 1.5 - 1.13 show the signal path in each function.

### (1) Speed Cal

Calibrates top indicator for zero speed deviation.

### (2) Speed Unweighted

Selects speed deviation in the top indicator and unweighted wow & flutter peak on the bottom indicator.

### (3) Speed Wow/Flutter

Selects speed deviation on the top indicator and weighted wow & flutter peak on the bottom indicator.

### (4) Level T.H. Distortion L

Selects left channel level on the top indicator and left channel total harmonic distortion on the bottom indicator.

### (5) Level T.H. Distortion R

Selects right channel level on the top indicator and right channel total harmonic distortion on the bottom indicator.

### (6) Level

Selects left channel level on the top indicator and right channel level on the bottom indicator.

### (7) Level -20 dB

Decreases oscillator output by 20 dB while simultaneously making the indicators 20 dB more sensitive.

Selects left channel level on the top indicator and right channel level on the bottom indicator.

### (8) Noise -40 dB

Displays left channel A-weighted noise on the top indicator and right channel A-weighted noise on the bottom indicator.

Makes the display 40 dB more sensitive.

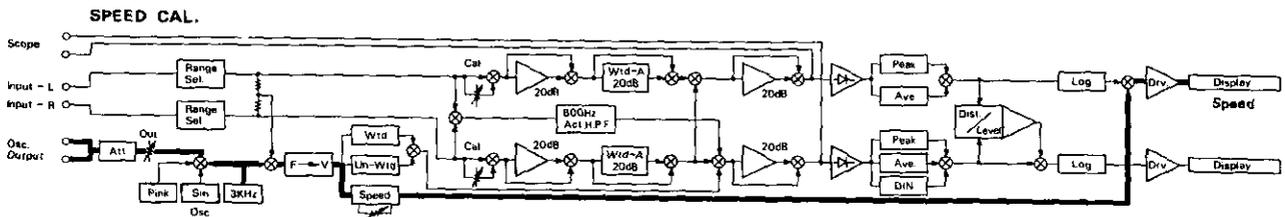

Fig. 1.5

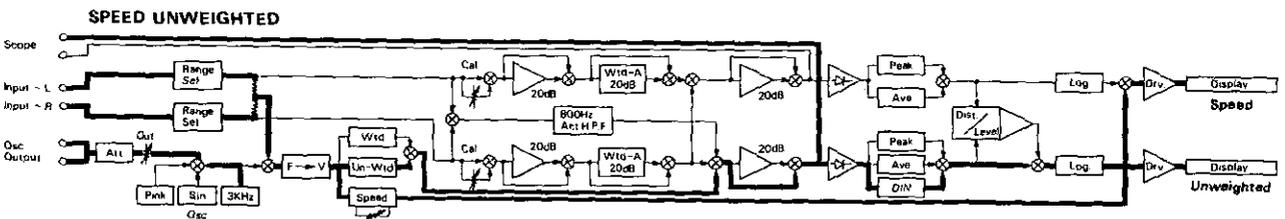

Fig. 1.6

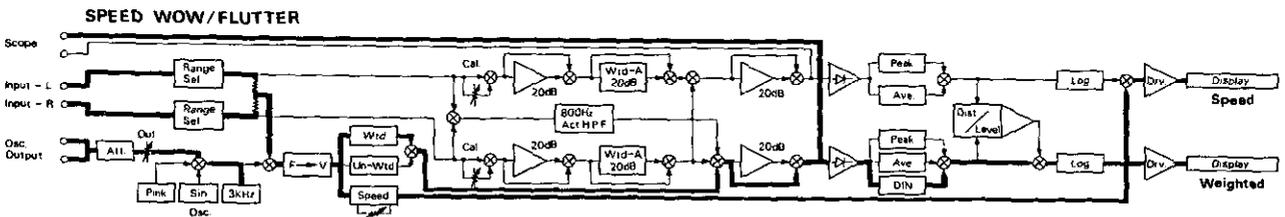

Fig. 1.7

**(9) Peak**

Selects peak-reading ballistics for the level display. Selects left channel level on the top indicator, right channel level on the bottom indicator. When the left and right input level controls are turned to maximum, the sensitivity of

the display is the same as when the function control is set to "level".

However, by turning the input level controls counter-clockwise, you can reduce the sensitivity to any intermediate value.

**1.4. How To Read Signals**

In the Switch P.C.B. circuit, preceding 9 functions are symbolized as follows:

- A: Speed Cal.
- B: Speed Unweighted
- C: Speed Wow/Flutter (DIN WTD)
- D: Level T.H. Dist. (400 Hz) L
- E: Level T.H. Dist. (400 Hz) R
- F: Level 0 dB
- G: Level -20 dB
- H: Noise IHF-A (-40 dB)
- I: Peak Level

Functions A to I are combined and described logically such as  $A + B + C$ ,  $\overline{A + B + C}$ , etc. The meaning of these signals are:

- $A + B + C$ : will be "H" (i.e., will be effective) if function A OR B OR C is selected.
- $\overline{A + B + C}$ : will be "L" (i.e., will be effective) if function A OR B OR C is selected.

- Notes: 1. If the function other than A, B, or C is selected, signals  $A + B + C$  and  $\overline{A + B + C}$  become open in the Switch P.C.B. circuit, but in the next stage -10 V or +10 V bias is applied to signal  $A + B + C$  or  $\overline{A + B + C}$ . Thus, the "L" or "H" level is obtained.
2. "H" and "L" levels should be as follows:  
 "H": +6.5 V - +10 V  
 "L": -10 V - -7.5V

Fig. 1.14 shows the actual circuit. Common terminal of the Function Switch is connected to +10 V or -10 V and terminals A, B and C become inputs of DIODE OR Gate.

**1.5. Semiconductor Switch**

Circuits are controlled by the semiconductor switch of FET and transistor. Below shown is the table for the semiconductor switch and equivalent mechanical switch.

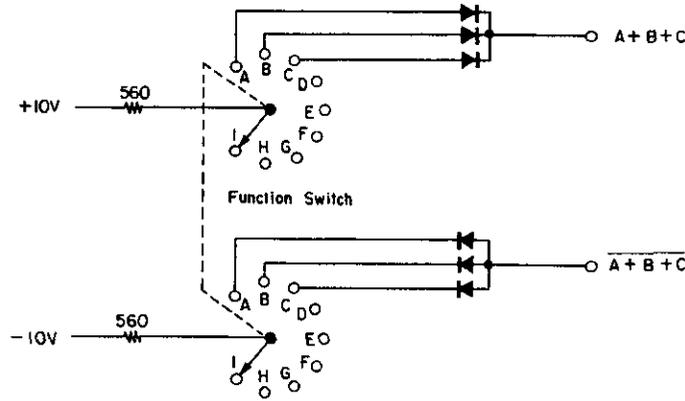

Fig. 1.14

Table 1.1

	Circuit	Control Input	Mechanical Switch
FET		High (+10V)	ON
		Low (-10V)	OFF
Transistor		High (+10V)	ON
		Low (-10V)	OFF

## 10. TROUBLESHOOTING

### 10.1. Notes

- (1) Referring to the Owner's Manual, operate the Audio Analyzer T-100, and establish which circuit is in trouble.
- (2) Remove the covers, the printed-circuit boards, etc., and visually check the parts, wiring or conductive pattern of the printed-circuit board for abnormalities. Various abnormalities may be found through visual check such as burnt elements, broken wires, cold soldering and loose connections of connectors.
- (3) Check to insure whether the outputs +10 V and -10 V of the Power Supply Circuit are correct.
- (4) Check to insure whether the output AC 60 V of the Power Supply Circuit is correct.
- (5) Check the operation of circuits having trouble with a VOM or an oscilloscope according to the circuit diagram.
