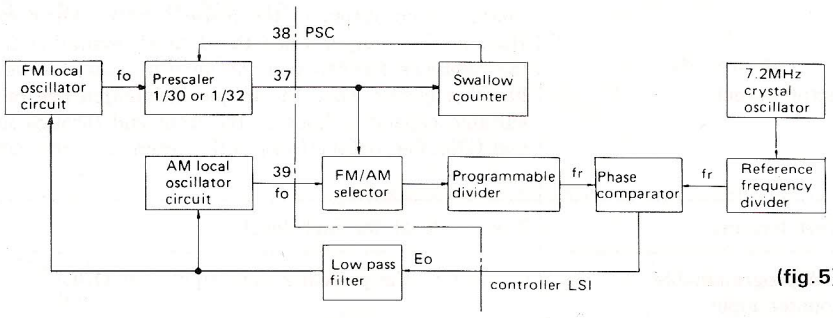
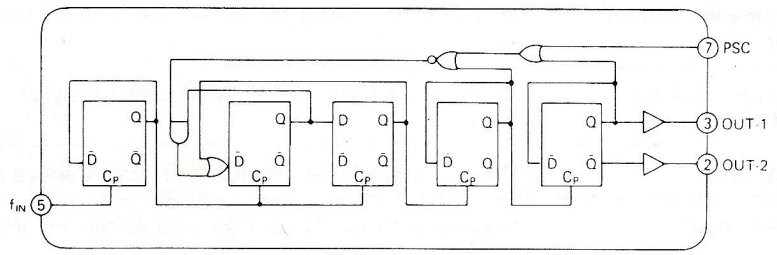
2.PLL tuned circuit



(fig.5)



TD6104P (Prescaler)

A block diagram of the tuned of the PLL is shown in fig. 5.

Operation during AM reception

The reception frequency is applied to the programmable divider where it is divided to 1/N and output as fv.This is applied to the phase comparator where it is comparated with frequency reference fr(9kHz for G/W models and 10kHz for D model). If fr and fv differ, Eo equal to the difference in frequency is output.Since error output Eo is a pulse waveform, it is passed through the low pass filter to change it into DC voltage Vd,which is applied to the variable capacitor diode in the front end to change the reception frequency.This continues until fv and fr are the same and Eo=0.

Operation during FM reception

The pulse swallow method is used in the prescaler of this unit. In this type of prescaler, a supplementary number (changed accordimg to the program code input) and the divided reception frequency from the prescaler are combined in the control counter and the prescaler's division factor is switched 1/30 or 1/32 according to external control(1/32 when the PSC terminal is "H" and 1/30 when it is "L").

The station oscillator frequency is applied to the programmable divider,but the programmable divider has an upper frequency limit of only 30MHz,so the pulse swallow-type prescaler,which can be used up to 150MHz,is inserted for division to 1/Np;

The signal is applied to the programmable divider and divided to 1/N. The result is compared with a 25kHz frequency reference in the phase detector and error is output as Eo until a match is obtained as in AM operation.

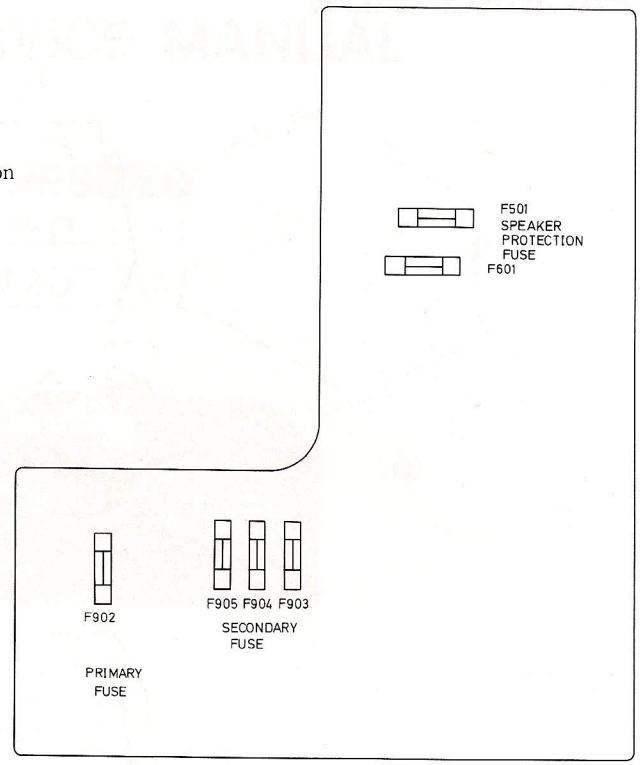
SERVICE PROCEDURES

1.Replacing the fuses

For continued protection against fire hazard,replace only with same type and same rating fuse.

Circuit no.	Part no.	Description
F501,F601	252075	2.5A-SE-EAK,Speaker protection
F902	252073	1.6A-SE-EAK,Primary
F903,F904	252077	4A-SE-EAK,Secondary
F905	252070	1A-SE-EAK,Secondary



2.Memroy preservation

This unit does not require memory preservation batteries. A built-in memory power back-up system preserves contents of the memory during power failures and even when the unit is unplugged. The unit must be plugged in and the power switch turned on and off once in order to charge the back-up system. Note that since this is not a permanent memory,the power switch must be turned on and off a few times each month to keep the back-up system operative. The period of time during which memory contents are preserved after power has last been turned off varies depending on climate and placement of the unit. On the average, memory contents are protected over a period of 3 to 4 weeks (a minimum of 2 weeks) after the last time power has been turned off. This period is shorter when the unit is exposed to very high humidity or used in an area with an extremely humid climate.
