ONKYO®
AUDIO COMPONENTS

MICROCOMPUTER OPERATION

Q201 LM6405H-070

Pin	Function
1	Connect the 800kHz oscillator Xtal.
2	Pins for electrical adjustment of stylus height; adjust stylus height when tonearm goes open to standby.
3	Open J263 to lower the stylus height 1.9mm.
4	Open J264 to lower stylus height 3.8mm. Open J23, 264 to lower the stylus height 5.7mm. Open J263 to lower the stylus height 7.5mm.
5	Pin for muting on/off; low is on, high is off.
6	Pin for interruption of repeat operation.
7	Pin for reset; low for 80m sec when power is turned on.
8	Determines whether or not tonearm is above the stanolby position; low when arm is above the standby position.
9	Sensor input; low to operate the air drive motor, high to stop the arim drive motor.
10	Pin for the record end detection signal from the sensor; low causes the tonearm to return.
11	Determines whether or not the tonearm is open or standby.
12	Pins for the tonearm drive (horizontal movement) pulse motor
13	
14	
15	
16	Pins for the tonearm drive (vertical movement) pulse motor
17	
18	
19	

20	Test pin
21	Ground pin
22	} Pin for adjustment of the 17cm lead-in position. See the adjustments section for details.
23	
24	
25	} Determines the point of return when the tonearm is moved inward in the search mode or when the end is reached.
26	
27	
28	
29	
30	Lights the repeat LED.
31	Pin for direct-drive motor on/off and the play flip-flop clear direct-drive motor; low is stop and high is start.
32	Lights the memory LED.
33	Pin for adjustment of how far the dust opens; when J243 is open, the angle can be adjusted by about 5°
34	Determines whether the record is 30cm or 17cm.
35	Pin to memorize the end point; the number of pulses from the arm standby position is memorized.
36	Pin to memorize the start point as described in 35 above.
37	Pin for open/standby operation; hole down and open-standby switching will be repeated.
38	Pin for search operation; press once and the pulse motor moves the tonearm inward, press again and the pulse motor rotates in the opposite direction to move the tonearm outward.
39	Pin for cueing up/down operation.
40	Pin for play/stop operation. An operation pulse is generated after about 1.5 seconds when the tonearm is in the standby position. Stop is ordered the instant the arm moves from the standby position toward the record.
41	V _{DD} : supplies 5 volts

ADJUSTMENT PROCEDURES

1. Adjusting Stylus Height

1. Move the tonearm slightly with the search button (check for rest switch operation).
2. Stop the turntable with your hand.
3. Lower the tonearm by pressing the cueing button.
4. Turn the power off and raise the tonearm.
5. Adjust with a philips head screwdriver on counterweight so that the stylus is 3.5 to 6mm above the T.T mat. (see mechanism diagram)
6. Turn the power on and press the open/stand-by switch to raise the tonearm and return it to the stand-by position.
7. Adjust J263, 264 and 265 so that the stylus is 3.5 to 6mm above the T.T mat.
Cut J263 to lower the stylus 1.8mm.
Cut J264 to lower the stylus 3.6mm.
Cut J265 to lower the stylus 5.4mm.

2. Adjusting the Lead-in Position

- * 30cm adjustment
Using an ES-1008 test record, adjust with a flat head screwdriver on the counterweight (see mechanism diagram) so there are 25 to 32 counts.
- * 17cm adjustment
Using an ES-1008 test record, adjust J248, 249, 250 and 251 so there are 22 to 35 pulse counts. (Use a test record with the outer edge cut away or with small holes in it.)
Cut J251 to move the count 5 ~ 6 inward.
Cut J250 to move the count 11 ~ 12 inward.
Cut J248 to move the count 22 ~ 23 inward.
Cut J248 to move the count 44 ~ 45 inward.

3. Adjusting Sensor Sensitivity

1. Connect an oscilloscope to TP-A (Emitter of Q208).
2. In the stand-by position, move the stylus toward the center of the turntable platter (so the sensor holder is outside D601 and Q601) and adjust R208 so that 3 volts is produced.

4. Adjusting the Sensor Shutter

1. Connect an oscilloscope to TP-C (Collector of Q209).
2. In the stand-by position, adjust the sensor holder so that the sensor switches from high to low when the stylus is moved 3mm toward the center of the turntable platter.

5. Adjusting the Return Position

1. Connect an oscilloscope to TP-B (Base of Q210).
2. In the stand-by position, adjust R211 so that the V_{BE} voltage is 0.6 to 0.7 when the stylus is moved toward the center of the turntable platter.
3. Checkpoints (use an ES-1008 test record):
 - a) Set the speed selector to 33rpm.
 - b) When trace the 1mm pitch of record, V_{BE} voltage is -0.05 to -0.08 in relation to the adjustment voltage (0.6 to 0.7 volts).
 - c) Confirm that the tonearm returns within 7 counts at the 3mm pitch trace.
 - d) Confirm that the tonearm returns more than 21 counts at the 1mm pitch trace.

6. Adjustment of Motor Speed (rpm)

Adjust the semi-fixed resistors VR₃₃ and VR₄₅ so that the motor speed is within ±0.15%.

SPECIFICATIONS

Type:	Direct drive linear tracking turntable with two microcomputer controlled motors and fully automatic operation
Turntable Platter:	300 mm (12") aluminum die-cast
Motor:	Brushless DC direct drive
Speeds:	33-1/3, 45 rpm
Wow & Flutter:	0.027% (WRMS)
Signal-to-Noise Ratio:	72 dB (DIN B)
Tonearm:	Statically balanced, carbon fiber
Cartridge:	Dual magnet type, model OC-56V
Frequency Response:	20 – 25,000 Hz
Output Voltage:	3.5 mV (1 kHz)
Compliance:	8×10^{-6} cm/dyne
Tracking Force:	2.0 grams
Stylus:	0.6 mil. round diamond
Replacement Stylus:	DN-56ST
Power Supply:	220 V, 50 Hz, 120/220 V, 50/60 Hz
Dimensions (W x H x D):	330 x 126 x 338 mm (13" x 5" x 13-1/4")
Weight:	6.5 kg (14.4 lbs.)

* Specifications are subject to change due to further product improvements.
