STEREO CASSETTE

TAPE DECK

MODEL TA-R33

Silver and Black models

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY MARK  ON THE SCHEMATIC DIAGRAM AND IN THE PARTS LIST ARE CRITICAL FOR RISK OF FIRE AND ELECTRIC SHOCK. REPLACE THESE COMPONENTS WITH ONKYO PARTS WHOSE PARTS NUMBERS APPEAR AS SHOWN IN THIS MANUAL.

MAKE LEAKAGE-CURRENT OR RESISTANCE MEASUREMENTS TO DETERMINE THAT EXPOSED PARTS ARE ACCEPTABLY INSULATED FROM THE SUPPLY CIRCUIT BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

SPECIFICATIONS

Track System:	4-track, 2-channel stereo
Recording System:	AC bias
Erasing System:	AC erase
Tape Speed:	4.8 cm/sec
Wow and Flutter:	0.05% (WRMS)
Frequency Response:	20–15,000Hz (Normal) (30–14,000Hz ± 3dB) 20–16,000Hz (High) (30–15,000Hz ± 3dB) 20–17,000Hz (Metal) (30–16,000Hz ± 3dB)
S/N Ratio:	Dolby NR out: 60 dB (metal position tape) A noise reduction of 10 dB above 5 kHz and 5 dB at 1 kHz is possible with Dolby B. A noise reduction of 20 dB at 5 kHz is possible with Dolby C.
Input Jacks:	Mic Jacks: 2 Input sensitivity: 0.3 mV/600 ohms Input impedance: 2.7 kohms
Outputs:	Line IN: 2 Input sensitivity: 60 mV Input impedance: 50 kohms
Motors:	Line OUT: 2 Std output level: 500mV (0 dB) Opt load impedance: over 50 kohms Headphone Jack: 1 Opt load impedance: 8–200 ohms DC servo: 1 DC motor: 2

ONKYO®
AUDIO COMPONENTS

Heads:	Rec/PB head: Special Hard Permalloy Erase head: Ferrite
Semiconductors:	TR: 64 Diodes: 34 IC: 13 LED: 17
Power Supply:	AC120V/60 Hz
Power Consumption:	25 watts
Dimensions:	418(W) x 112(H) x 270(D) mm (16-1/2" x 4-3/8" x 10-5/8")
Weight:	5.1 kg. (11.2 lbs.)

Specifications and external appearances are subject to change without notice because of product improvements.

SERVICE PROCEDURES

1. Replacing the lamp

This unit used the lamp listed below.

Circuit No.	Parts No.	Description
PL-901	210090	PL14V 150mA

Caution; Before replacing the lamp. Be sure to unplug the power supply cable.

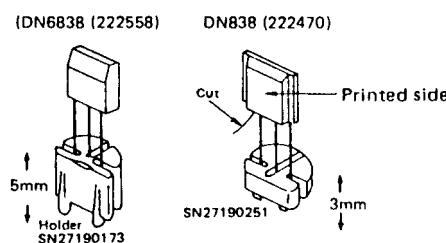

2. Instruction resistance measurement

Connect the insulating-resistance tester between the plug of power supply cord and chassis.

Specifications; 500V more than 10MΩ

3. Replacing the Hall ICs

Cautions: As the position of leg of DN6838 and DN838 differ, use the same Hall IC when replacing.

SPECIAL MODES OF OPERATION

Auto-reverse operation

This unit includes an auto-reverse function that automatically reverses the direction of tape travel in the playback or record modes when the end of the magnetic tape is reached. Tape travel is reversed as soon as a photo sensor detects the presence of the clear leader. In other words, as soon as the sensing light ray passes through the tape, the direction of tape travel is reversed.

The reversal time interval is extremely short so that the silent gap during playback is barely noticeable. If the cassette tape does not have a clear leader section, tape travel is reversed the instant the end of the tape (including leader) is reached.

When defective cassette tapes having pin holes or other damage which allows light to pass through the tape, auto-reverse may be activated at that point. To prevent this from happening, play and record these tapes using the one side tape transport mode in which auto-reverse is not activated under any circumstances.

Notes:

- Because of slight physical differences between cassette halves, cassettes recorded in the forward direction should be played back in the forward direction to obtain the best results.
- When recording, the direction of tape travel only switches from forward to reverse. To keep track of which side is being recorded so that you do not mistakenly use an already recorded side, it is a good idea to always place side A facing outward for recording operations.

Blank skip operation

When the blank skip button 21 is pressed while a tape is being played back, blank (unrecorded) sections of tape of more than 20 seconds in length are automatically skipped over in the fast forward mode. Tape winding stops at the beginning of the next recorded section and playback is automatically resumed.

When playing back a long section of quiet music, press this button again to turn the blank skip function off to prevent mistaken operation.

The Automatic Tape Selection System

This deck automatically detects the type of cassette that has been loaded in cassette holder and sets the bias and equalization to the correct settings. The cassette type is then displayed by the Tape Selector Indicator 7. Tape selection is performed by detecting the presence or absence of identification pits on the back of the cassette shell. Cassettes manufactured before this identification system was adopted and bargain cassettes that do not incorporate these pits can not be used with this deck.

MECHANISM OPERATIONS

1. Tape Transport Mechanism Drive

1-1 Outline

The R33 tape transport uses an assist motor to rotate and raise and lower the head base, the same motor assist method as that used in the TA-R77 and other decks. However, the tape transport position detection method, head position determining method and assist motor braking method are different. Tape transport position detection is performed using

a rotary switch as shown in figure 1. As in previous decks, it is divided into ranges in which operation is allowed and prohibited. However, instead of allotting each of these two ranges a different code, the edge of each pattern is used as the starting point for operation. These patterns are divided between those for forward and reverse operation. All patterns except the forward one are symmetrical left to right. The forward pattern is used to detect the direction of tape travel; when the transport mechanism is in the forward side, the brush causes contact with COM to set the ground level.

Determination of the head position is done by the stopper when a precise amount of head insertion is required (for PLAY-REC and AMCS). Therefore, the transport is constructed so that the head position does not change even if the assist motor rotates too far. However, there is no head position determining stopper for FF, REW and STOP. In these cases, braking is performed using the motor driver IC which has a brake function and by reversing the assist motor, see section 1-3 for details.

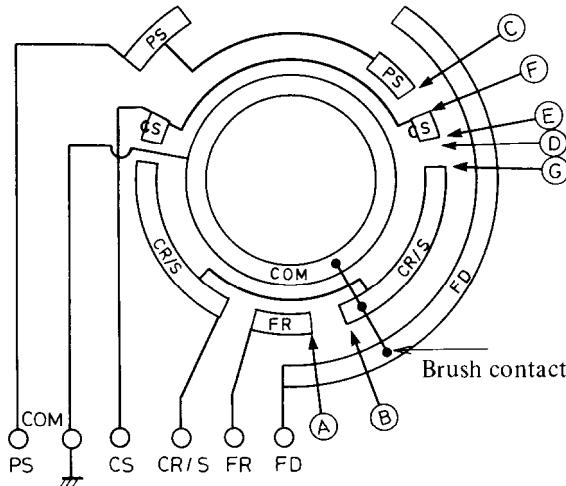

Fig. 1 Rotary Switch Patterns

1-2 Transport Mechanism Drive Method

1-2-1 FF and REW: The assist motor is rotated in the direction of the FR pattern (the direction of rotation is reversed for the forward and reverse sides). The FR signal is observed and, when it becomes 0V (when point A is reached), the brake is applied to the assist motor and the reel motor rotates according to the FF or REW command. The method by which the brake is applied to the assist motor is explained in section 1-3.

1-2-2 STOP: when stopping from the FF or REW mode, the CR/S signal is observed and, when it becomes 0V (when point B is reached), the brake is applied to the assist motor. When stopping from the PLAY or REC mode, the assist motor is rotated to point A and then it is rotated in the opposite direction to the STOP position in the same method as when stopping from FF or REW.

1-2-3 PLAY (REC): The PS pattern is used to determine the PLAY position. When the edge of the PS pattern is detected (when point C is reached), the head base has already contacted the stopper so that the assist motor is rotated up to this point. However, the capstan and pinch roller contacted each other at a point in the CS pattern on the side toward the CR/S pattern (point D). Therefore, about 20 msec. after point E is detected 0--PLAY is output to rotate the reel motor to take up the tape. When recording, the BIAS CONT. signal is simultaneously output. When switching from PLAY to STOP, 0--PLAY is switched off to stop the reel motor about 20 msec. after point F is detected.

1-2-4 AMCS: To perform song location operation, the stopper must be moved outward to set the head base position. The same construction as that used for the reel motor swing mechanism is employed. By rotating the reel motor, the stopper protrudes on the right and left sides. However, the stopper can move freely only over the vicinity of the edge of the CR/S pattern on the CS side. At all other points, the stopper does not protrude on either side even when the reel motor rotates. Because of this, in the PLAY operation described in 1-2-3, the reel motor is rotated 20 msec. after the CS signal is detected just to be safe. During song location operation, starting the reel motor to move the stopper immediately after the CR/S signal has ended (point G) is too late because the beginning of the song may have already been passed before the head base strikes the stopper. However, since it is not possible to detect the point just before the CR/S signal ends, the assist motor is rotated until point C is detected. Then the assist motor is reversed and stopped when point G is detected. This point is the point just before the CR/S signal ends. From here on, the assist and reel motors are both

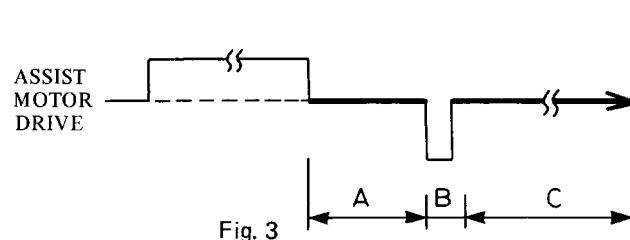

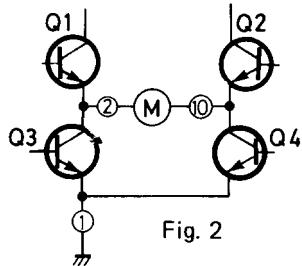

driven. The reel motor moves the stopper and the tape; the assist motor rotates until point E is detected.

NOTE: When the unit is repaired, the song location stopper will fall downward when the unit is placed on its side. This may cause the head base to be clamped at the song location position thereby putting the unit in the song location mode.

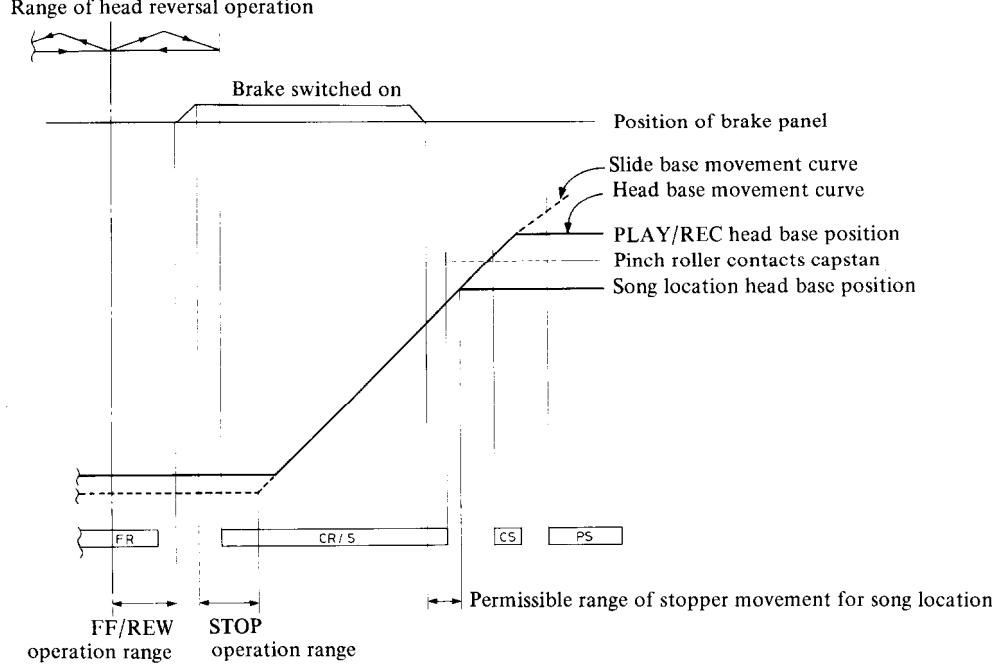

1-3 Assist Motor Braking

As explained in section 1-2, the stopper moves out to clamp the head position for PLAY (REC) and song location operation. Because of this, no problem is created if the assist motor rotates too far. However, for FF and REW, the direction of tape travel is switched if the assist motor is allowed to rotate beyond the specified point, so the motor must be stopped within a limited range. The assist motor drive IC includes a braking function.

Braking is activated when all input pins are either HIGH or LOW. In this case, both ends of the motor are shorted to apply the brake. That is, when Q1 and Q2 are off, Q3 and Q4 are on. For FF and REW, though, it is still possible for the motor to go too far using this braking method alone. To solve this problem, the assist motor is reversed when braking is applied.

This procedure is shown in figure 3 which shows that, when the desired location is reached, the brake is applied by the motor drive IC over the 15 msec. of interval A. The remaining rotational force of the motor is used to securely set the head base to the correct position (PLAY-REC). Next, the assist motor is reversed to absorb unnecessary rotational force over interval B. For PLAY and REC, this interval is 2 to 4 msec.; for other modes the interval is 4 to 8 msec. Interval C is the time until the assist motor is driven according to the next operation command; during this time, the brake is applied by the motor drive IC. In all previous motor assist methods, there has been a 50 msec. interval after the assist motor is driven to permit reconfirmation of the transport position. In this tape transport mechanism, however, the operation positions are all detected by HIGH-LOW (5V to 0V) signal changes instead of codes. Furthermore, these H-L changes are read twice over 4 msec. to permit reading the transport position a second time for reconfirmation.

1-4 Initial Transport Setting When Power is Switched On

Because the transport position detection rotary switch uses the pattern edges as starting points for operation, the assist motor must be rotated each time power is switched on to accurately set it to the STOP position. To do this, the assist motor is rotated until the FR signal becomes 0V. Of course, the motor rotates in the ASSIST DOWN direction for the forward side and in the opposite direction for the reverse side. When the 0V FR signal is confirmed, the assist motor is reversed and rotates until the CR/S signal is detected at which time the brake is applied.

The motor is now in the standard STOP position which is the initial setting for the tape transport mechanism.

1-5 Capstan Motor On/Off Switching

The capstan motor is switched on or off as shown for the operations listed in the following table.

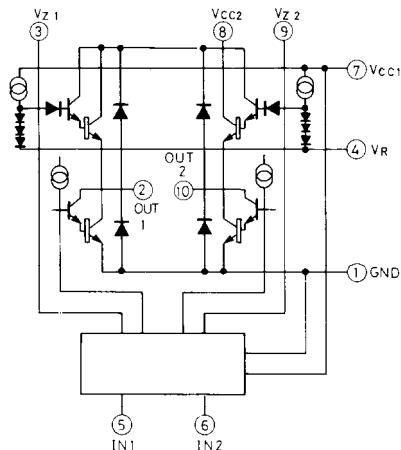

Capstan motor switched on	PLAY, REC
Capstan motor switched off	STOP, FF, REW, AMCS, PAUSE, REC/PAUSE, BLANK SKIP, Direction change
Capstan motor mode not changed	AUTO SPACE

1-6 Blank Skip Operation

When no signal is detected on the tape for more than 20 seconds during playback, blank skip functions just as the song location function to locate the beginning of the next song and then return the deck to the play mode. Blank skip operates only when the blank skip switch is on. The same blank tape detection circuit is used during both AMCS and standard playback; the gain is changed depending on whether AMCS or blank skip is being used.

Input level control pc board (NAVR—2026)

CIRCUIT NO.	PARTS NO.	DESCRIPTION
R217, R218	5104132	N16RKF50KA45F, Variable resis

Stereo headphone terminal pc board (NAHP—2027)

CIRCUIT NO.	PARTS NO.	DESCRIPTION
SJ301	25045139	HLJ-0540-01-010, Headphone terminal

Edge light pc board (NAPL—2028)

CIRCUIT NO.	PARTS NO.	DESCRIPTION
PL901	210090	PL14V, 150mA, Lamp

Timer switch pc board (NASW—2029)

CIRCUIT NO.	PARTS NO.	DESCRIPTION
S710, S711	25030231	NRS-123-25-SBM, Rotary switch

ADJUSTMENT PROCEDURES

PRECAUTIONS

1. Before adjustment, clean the following parts with an alcohol moistened swab.
 - * record/playback head * erase head
 - * pinch roller * capstan
2. Do not use magnetized screwdriver for adjustments.
3. Demagnetize record/playback head with a head demagnetizer.

TEST EQUIPMENT/TOOLS REQUIRED:

Audio oscillator

Digital frequency counter

Oscilloscope

Attenuator

AC voltmeter DC voltmeter

Non-magnetic screw driver

Blank tapes(completely erased)

NORMAL.....NEW UD90

HIGH.....NEW XL-II 90

METAL.....NEW MX60

Test tapes

VTT-658 : 10 kHz, -15dB

MTT-111 : 3 kHz, -10dB

MTT-150 : Dolby level calibration

400Hz tone 200mWb/m

MTT-215C : 315Hz, 10kHz

TW-2111 : Torque meter

MC-112C : Mirror tape

Item	Connection of instrument	LINE input	Test tape	Mode	Output indicator	Adjustment point	Adjust	Remarks
1 Playback torque			TW-2111	PB	TW-2111	R745	35 to 55gcm	
2 Tape speed	Frequency counter to LINE output terminal		MTT-111	PB	Frequency counter	Semi-fixed on the motor	3,000 to 3,010Hz	
3 Head azimuth	AC voltmeter and oscilloscope to LINE output terminal		VTT-658	PB	AC voltmeter	Head azimuth screws	Maximum and same phase at channels L and R.	See fig. 1 Set the semi-fixed resistors R129 and R130 to center position.
4 Playback level	AC voltmeter terminals TP-101 and TP-102		MTT-150	PB	AC voltmeter	R129(L) R130(R)	580mV	
5 Bias current	Fig. 2	1kHz, -20dB and 12kHz, -20dB	MAXELL UD-1, C90	REC/PB	AC voltmeter	FWD R445(L) R446(R) REV R443(L) R444(R)	Same level at REC/PB	INPUT VOLUME maximum
6 Record level	Fig. 2	1kHz		REC PAUSE	AC voltmeter	Attenuator or AF OSC output	350mV	INPUT VOLUME maximum
				REC/PB	AC voltmeter	R401(L) R402(R)	Same level at REC/PB.
