

ONKYO SERVICE MANUAL

QUARTZ SYNTHESIZED TUNER AMPLIFIER MODEL TX-37

Silver and black models

UD, UDN, BUD, BUDN	120V AC, 60Hz
UG, BUG	220V AC, 50Hz

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY MARK \triangle ON THE SCHEMATIC DIAGRAM AND IN THE PARTS LIST ARE CRITICAL FOR RISK OF FIRE AND ELECTRIC SHOCK. REPLACE THESE COMPONENTS WITH ONKYO PARTS WHOSE PARTS NUMBERS APPEAR AS SHOWN IN THIS MANUAL.

MAKE LEAKAGE-CURRENT OR RESISTANCE MEASUREMENTS TO DETERMINE THAT EXPOSED PARTS ARE ACCEPTABLY INSULATED FROM THE SUPPLY CIRCUIT BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

ONKYO
AUDIO COMPONENTS

SPECIFICATIONS

AMPLIFIER SECTION

Power Output:	55 watts per channel, min RMS, at 8 ohms, both channels driven, from 20Hz to 20kHz, with no more than 0.04% THD.
Musical Power Output:	2 x 120 watts at 4 ohms, 1kHz (DIN)
Continuous Power Output:	2 x 77 watts at 8 ohms, 1kHz (DIN)
Total Harmonic Distortion:	2 x 77 watts at 4 ohms, 1kHz (DIN)
IM Distortion:	2 x 55 watts at 8 ohms, 1kHz (DIN)
Damping Factor:	0.04% at rated power
Frequency Response:	0.04% at 1 watt output
RIAA Deviation:	0.04% at rated power
Sensitivity and Impedance:	0.04% at 1 watt output
Phono Overload:	35 at 8 ohms
Signal-to-Noise Ratio:	20 – 30,000 Hz ± 1 dB
Tone Controls:	20 – 20,000 Hz ± 0.8dB
Loudness (-30dB):	Phono: 2.5mV/50 kohms
Subsonic:	CD/Tape Play: 150mV/50 kohms
	Tape Rec: 150mV/3.5 kohms (phono)
	180mV RMS at 1 kHz, 0.04% THD
	Phono: 85dB (at 10mV input, A weighted)
	76dB (IHF A-202)
	CD/Tape: 95dB (A weighted)
	80dB (IHF A-202)
Bass:	± 10dB at 100Hz
Treble:	± 10dB at 10kHz
+7 dB at 70 Hz, +5 dB at 10kHz	
-6 dB at 15 Hz	

TUNER SECTION

FM:

	-G/W MODELS-	-D MODEL-
Tuning Range:	87.5 – 108.0 MHz (50kHz steps)	87.5 – 108.0 MHz (100kHz steps)
Usable Sensitivity:	Mono: 11.2dBf, 1.0µV, 75 ohms 0.9µV (S/N 26dB, 40kHz Devi.) 75 ohms DIN	Mono: 10.8dBf, 1.9µV Stereo: 17.2dBf, 4.0µV
50dB Quieting Sensitivity:	Stereo: 18.0dBf, 2.2µV, 75 ohms 23µV (S/N 46dB, 40kHz Devi.) 75 ohms DIN	
Capture Ratio:	Mono: 18.0dBf, 2.2µV 75 ohms	Mono: 17.2dBf, 4.0µV
Image Rejection Ratio:	Stereo: 37.2dBf, 20µV, 75 ohms	Stereo: 37.2dBf, 40µV
IF Rejection Ratio:	1.5dB	1.5dB

Specifications and features are subject to change without notice.

SERVICE PROCEDURES

1. Replacing the fuses

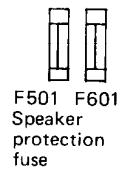

For continued protection against fire hazard, replace only with same type and same rating fuse.

D(120V)model

Circuit no.	Parts no.	Description
F501, F601	252059	4A (SS-2), Speaker
F901	252049	4A (ST-6), Primary

G (220V) and Q (240V) models

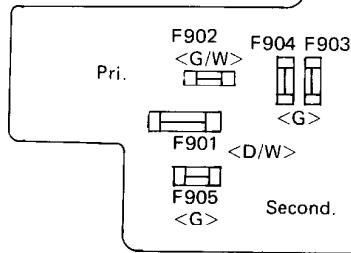

Circuit no.	Parts no.	Description
F501, F601	252077	4A-SE-EAK, Speaker
F902	252074	2A-SE-EAK, Primary
F903, F904	252078	5A-SE-EAK, Secondary
F905	252070	1A-SE-EAK, Secondary

2. Replacing the lamp

This unit uses the lamp listed below.

Circuit no.	Parts no.	Description
PL901	210064A	PL 6.3V, 250mA, Dial plate illumination

3. Safety—check out

(Only U.S.A. model)

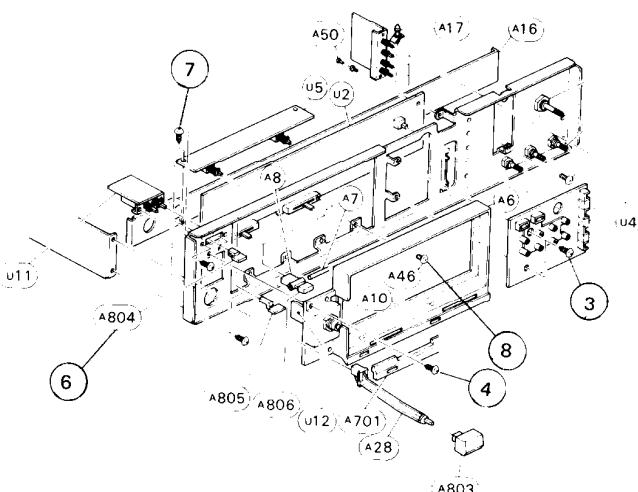

After correcting the original service problem, perform the following safety check before releasing the set to the customer.

Connect the insulating-resistance tester between the plug of power supply cord and nickel screw on the back panel.

Specifications: $3.3M\Omega \text{hm} \pm 10\%$ at 500V.

4. Removal of display pc board

- ① Remove the five screws holding the top cover and chassis (side bracket:4 back panel: 1), and remove the top cover.
- ② Remove the five screws holding the front panel and front bracket, and remove the front panel.
- ③ Remove the two screws holding the switch pc board and front bracket, and remove the switch pc board of U4.
- ④ Remove the four screws holding the holder and front bracket.
- ⑤ Remove the display pc board ass'y from the four nails of holder, and remove the holder.
- ⑥ Remove the two knobs (A805).
- ⑦ Remove the two screws holding the NAAF-2306 pc Board ass'y and center bracket, and remove the NAAF-2306.
- ⑧ Remove the four screws holding the switch of dynamic bass expander and front bracket, and remove the display pc board.

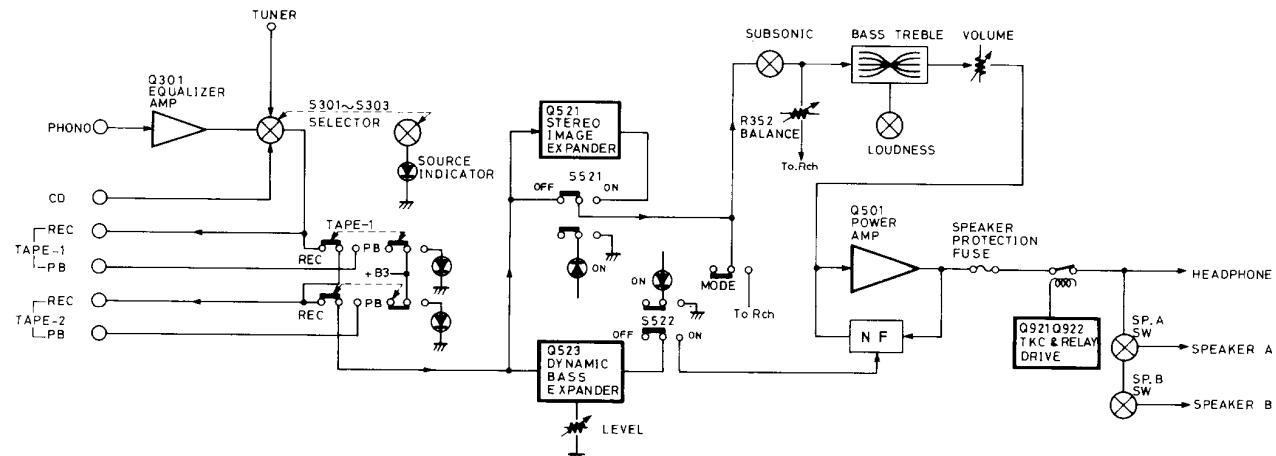

5. Memory preservation

This unit does not require memory preservation batteries. A built-in memory power back-up system preserves contents of the memory during power failures and even when the unit is unplugged. The unit must be plugged in and the power switch turned on and off once in order to charge the back-up system. Note that since this is not a permanent memory, the power switch must be turned on and off a few times each month to keep the back-up system operable. The period of time during which memory contents are preserved after power has last been turned off varies depending on climate and the location and placement of the unit. On the average, memory contents are protected over a period of 3 to 4 weeks (a minimum of 2 weeks) after the last time power has been turned off. This period is shorter when the unit is exposed to very high humidity or used in an area with an extremely humid climate.

-220V MODEL-

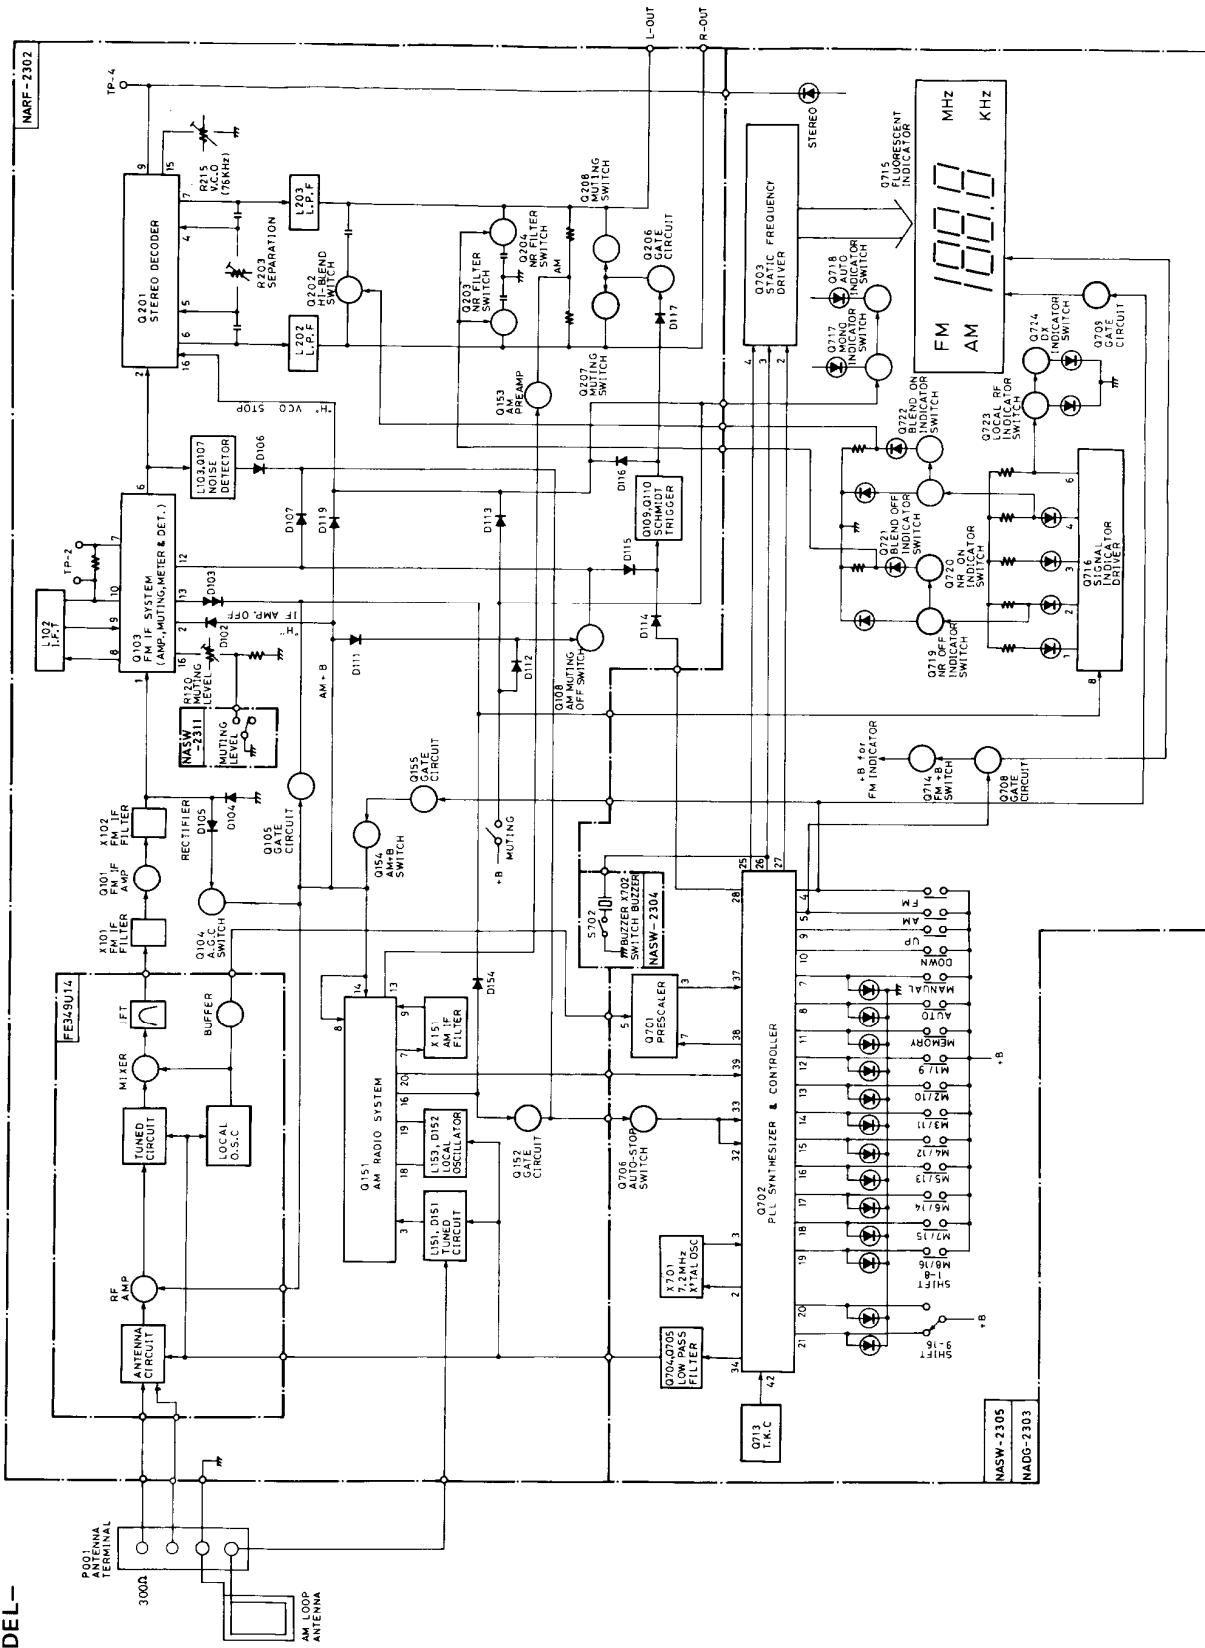

-DYNAMIC BASS EXPANDER-

In earlier super base systems, only the frequencies about 70Hz were boosted by about 4dB to expand the playback frequency response to enable playback of the super low region. However, when there was no input signal, the above frequency response resulted in deterioration in the S/N ratio in the 70Hz region. This problem has been overcome by the dynamic bass expander where the 70Hz boosted level is varied according to the input signal level. That is, the frequency response remains flat when no input signal is applied, but is boosted at the 70Hz region to the specified level when the input signal exceeds a certain level. The Left and right channel input signals from the INPUT terminals are mixed by Q523 and pass through the level volume and filter amplifier. The signal is rectified by D551 and D552, and the resultant DC component control signal is applied to the gate of Q525. When the input signal is at an adequate level, Q525 is turned on and the super base circuit of power amplifier is controlled by the input signal.

CIRCUIT DESCRIPTION

1. Synthesizer and controller operation

Pin No.	Symbol	Terminal	Description
1	GND	Ground	
2	XT	X'tal	Connected to the 7.2MHz crystal oscillator for the reference frequency.
3	XT		
4	FM	FM band specification input	
5	MW	MW band specification input	Mutual reset type, performs switching of each band, FM/MW/LW.
6	LW	LW band specification input	
7	MANUAL	Manual tuning mode specification input	
8	AUTO	Auto search tuning mode specification input	Mutual reset type, performs auto search and manual operation mode switching during UP/DOWN tuning.
9	UP	UP tuning key input	
10	DOWN	DOWN tuning key input	Connect the push key and perform UP/DOWN tuning.
11	STO	Memory store command input	The preset memory is set to the write mode when the key is pressed.
12-19	M1-M8	Preset memory channel specification input	Controls the write and read out of the internal 16-station preset memory along with the MC1 and MC2 input.
20	MC-1	Memory control input	Set the 16-station preset memory to the 8 FM/8 AM station mode or the FM/MW/LW 3-band 16-station random mode. The 8 FM/8 AM mode is used in this unit.
21	MC-2		
22	OSC2	AM oscillator terminal	CR connection terminal for the oscillator that determines the scan speed during the AM search mode.
23	OSC1	FM oscillator terminal	CR connection terminal for the oscillator that determines the scan speed during the FM search mode.
24	0/5	FM 50 kHz output	Output that represents the 50kHz FM band tuning step for European models. Goes to the high level for the 50 kHz setting.
25	CK2	Tuned frequency data output	Outputs the serial data and timing clock to the tuned frequency display driver.
26	CK1		
27	DATA		
28	MUTE	Muting signal output	Goes to the high level during muting output.
29	E2	Regin specification input	See table 1.
30	E1		
31	STOP 3	AM IF signal input	During AM reception, this counts the IF signal and stops auto search.
32	STOP 2	Auto search stop signal input	When the stop 1 input (pin 33) is at the high level and this terminal goes to the high level, auto search is stopped.
33	STOP 1	Scan speed slow input	When the high level is input at this terminal, the auto search speed is cut in half.

Pin No.	Symbol	Terminal	Description
34	D01	Error output	Charge pump output of the phase detector which constitutes the PLL. High level is output when the divided oscillation frequency is high than the reference frequency. In the opposite case, low level is output. Floating occurs when the frequencies match. The output is applied to the variable capacitor diode in the front end through low pass filter Q704 and Q705. The output from both terminals is the same, but only D01 is used.
35	D02		
36	TEST	Test terminal	Test mode at the high level.
37	FM IN	FM programmable counter input	Connect to the prescaler output (Pin3 of Q701)
38	PSC	Pulse swallow control output	Output to the control the division ratio of the prescaler.
39	AM IN	AM local oscillator signal input	Terminal for input of AM broadcast signal.
40	INH	Inhibit input	Operates normally at the high level. Inhibit status at the low level.
41	INT	Initialize input	Operates normally at the high level. At the low level, the internal status is initialized.
42	V _{DD}	Power supply	Device power terminal; supplies 5V during the normal operation and 2.5V from the super capacitor (C712) for memory preservation.

table 1.

E1 (Pin 20)	E2 (Pin 29)	Regin	Band	Frequency range	Intermediate frequency	Scan step	Reference frequency
0	1	U.S.A	FM	87.5 ~ 108.0 MHz	+10.7 MHz	100 kHz	25 kHz
			AM1	520 ~ 1 710 kHz	+450 kHz	10kHz	10 kHz
		Europe	AM2	522 ~ 1 710 kHz	+450 kHz	9kHz	9kHz
			FM	87.50 ~ 108.00 MHz	+10.7 MHz	50 kHz	25 kHz
1	0	Europe	MW	522 ~ 1611 kHz	+450 kHz	9 kHz	9 kHz
			LM	153 ~ 360 kHz	+450 kHz	1 kHz	1 kHz
		Japan	FM	76.0 ~ 90.0 MHz	-10.7 MHz	100 kHz	25 kHz
			AM	522 ~ 1611 kHz	+450 kHz	9 kHz	9 kHz

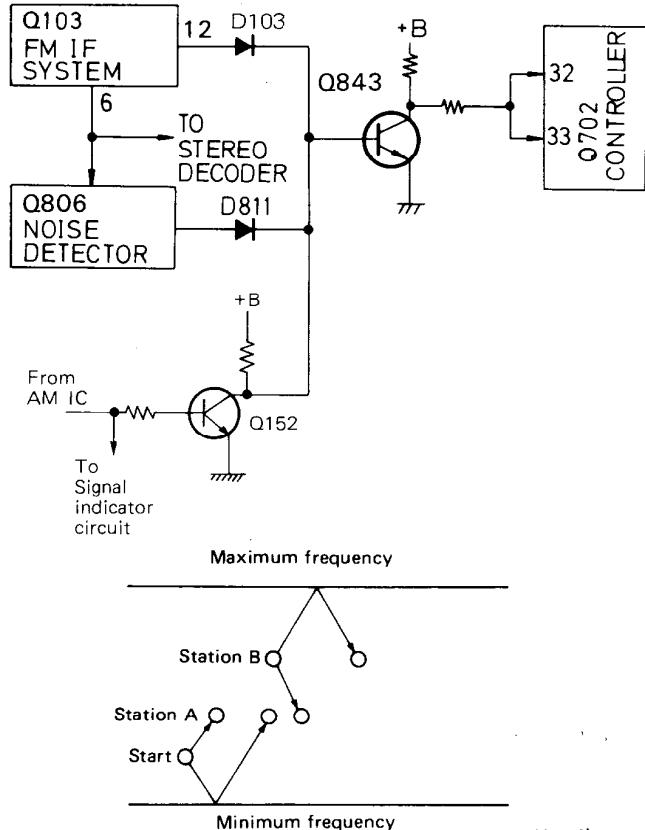

2. Auto Hi-blend and NR switch circuit

The Q103 FM IF system incorporates IC's with a built-in IF level detector with a 13 pin output.

If an input above 38dB enters the antenna, the 4 pin of Q716 signal driver becomes low level, the Q721 is turned on, the Q722 and Q202 are turned off and the high blend function is turned off.

If an input above 17dB enters the antenna, the 2 pin of Q716 signal driver becomes low level, the Q719 is turned on, the Q720, Q203 and Q204 are turned off and the NR function is turned off.

3. Auto search tuning circuit

(fig. 4)

During FM reception, this is operated by the IF level detection and zero point detection circuits included in the FM IF system IC of Q103 and by the noise component detection circuit of Q806. When a station is tuned, the output of all outputs go to the low level so Q843 goes from on to off, causing pins 32 and 33 of the controller IC to go to the high level to complete auto search tuning.

During AM reception, this is operated by the IF level detection included in the AM radio system IC of Q151. When a station is turned, Q152 goes from off to on and Q706 goes to off, causing pins 32 and 33 of the controller IC to go to the high level to complete auto search tuning.

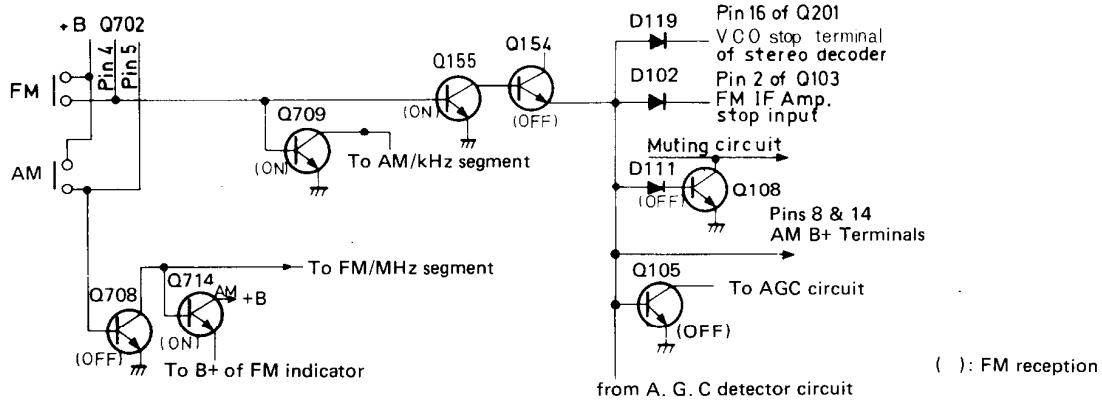

- Manual Tuning

When the UP or DOWN key is pressed, the frequency goes up or down by one step. When either key is held down, the frequency rapidly increases or decreases (scans) and stops when the key is released. When either end of the turning range is reached, key input will no longer be received and the frequency will stop at the highest or lowest frequency.

- Auto Tuning

When the UP or DOWN key is pressed, scanning begins in the up or down direction, stopping where there is a radio station. Since auto scan is operated by a triangular wave, scanning is begun in the opposite direction the instant either end of the tuning range is reached. Also, if the UP or DOWN key is pressed when the tuned frequency is not at either end of the range, up or down scanning will begin.

4. FM/AM switch circuit

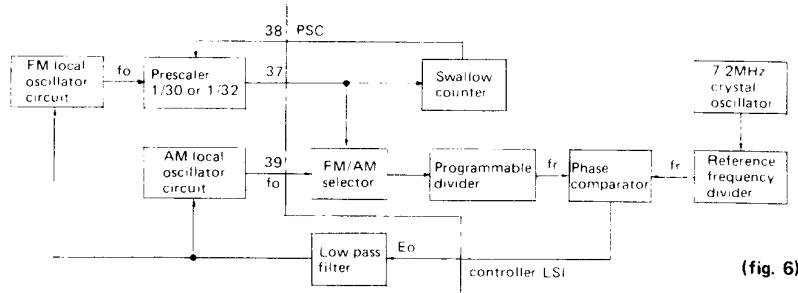

(fig. 5)

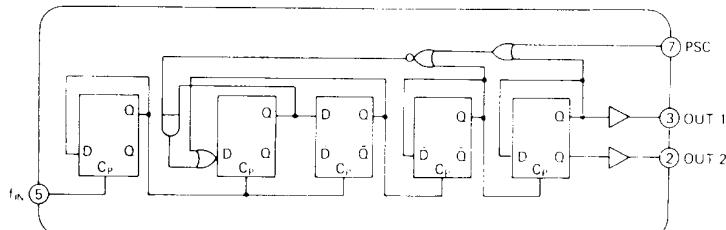

The FM/AM selector circuit is shown in the diagram, fig.5. Pins 4 and 5 of Q702 are of the mutual reset type. For FM, pin 4 is high and pin 5 is low; for AM, pin 4 is low and pin 5 is high. Because pin 5 is high and pin 4 is low during AM reception, Q709 is off, the AM, kHz segments of the fluorescent display are turned on. Also, since Q708 goes to on and Q714 is turned off, and the FM indicators are turned off. At the same time, Q155 is turned off and Q154 turned on, so +B is supplied to the power source terminal of the radio.

system pins 8 & 14 of Q151. Pin 16 of Q201 goes to the high level, the VCO oscillator stops, and pin 2 of Q103 gose to the high level so the FM IF amp is also switched off. Also, during AM reception, Q108 is turned on so the muting circuit is off. During FM reception, all of the switching transistors mentioned above perform the opposite operations to switch to the FM mode. Figures in parenthese indicate transistor operation during FM reception.

5. PLL tuned circuit

(fig. 6)

(fig 7) TD6104P (Prescaler)

A block diagram of the tuned circuit of the PLL is shown in figure 6.

Operation during AM reception

The reception frequency is applied to the programmable divider where it is divided to 1/N and output as fv. This is applied to the phase comparator where it is compared with frequency reference fr (9kHz for G/W model and 10kHz for D model). If fr and fv differ, Eo equal to the difference in frequency is output. Since error output Eo is a pulse waveform, it is passed through the low pass filter to change it into DC voltage V_D, which is applied to the variable capacitor diode in the front end to change the reception frequency. This continues until fv and fr are the same and Eo=0.

Operation during FM reception

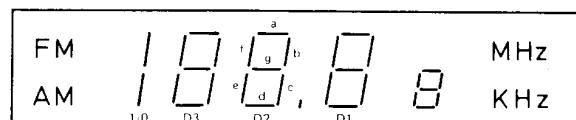

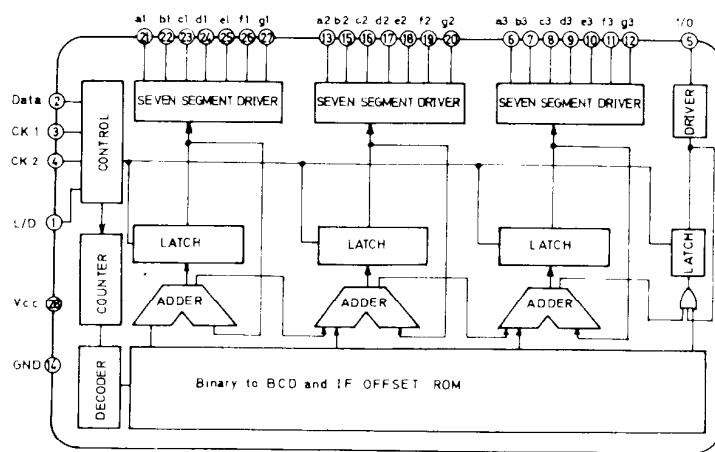

The pulse swallow method is used in the prescaler of this unit. In this type of prescaler, a supplementary number

(changed according to the program code input) and the divided reception frequency from the prescaler are combined in the control counter and the prescaler's division factor is switched 1/30 or 1/32 according to external control (1/32 when the PSC terminal is "H" and 1/30 when it is "L").

The station oscillator frequency is applied to the programmable divider, but the programmable divider has an upper frequency limit of only 30MHz, so the pulse swallow-type prescaler, which can be used up to 150 MHz, is inserted for division to 1/Np;

The signal is applied to the programmable divider and divided to 1/N. The result is compared with a 25kHz frequency reference in the phase detector and the error is output as Eo until a match is obtained as in AM operation.

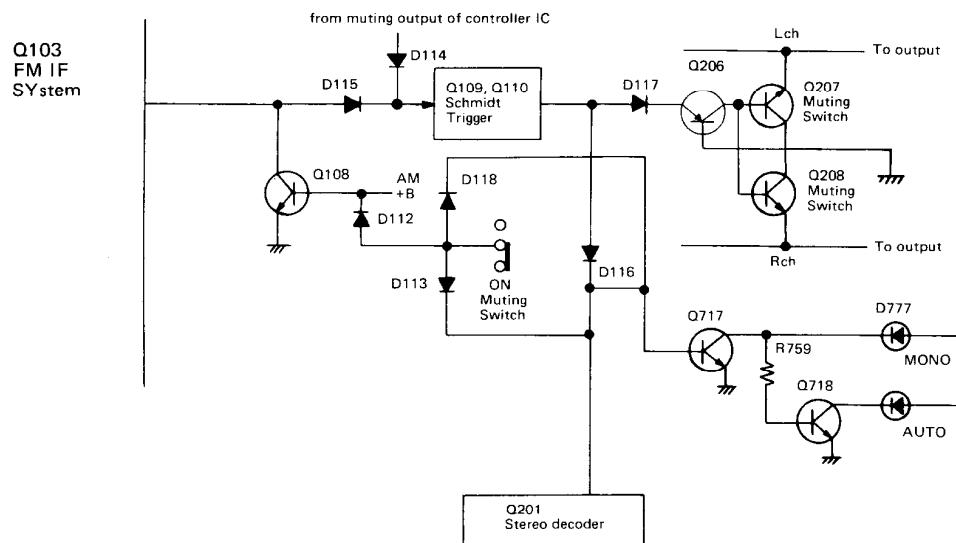

6. Frequency indicator circuit

(fig. 8) TD6301AP block diagram

Pin No.	Terminal	Description
1	L/D	Output indication switching input terminal: Fluorescent display at the low level, and LED display at the high level.
2	Data	Tuned frequency data input terminal: Input from the system controller LSI to the serial.
3,4	CK1, CK2	Tuned frequency data input control timing input terminal: Transferred simultaneously with data from the system controller LSI.
5	I/O	Segment drive output terminal: Sets the number of display digit for FM (100MHz) and AM (1.000kHz) reception.
6-12	a3-g3	Seven segment drive output terminals: Sets the number of display digit for FM(10MHz) and AM (100kHz) reception.
13, 15-20	a2-g2	Seven segment drive output terminals: Sets the number of display digit for FM (1MHz) and AM (10kHz) reception
21-27	a1-g1	Seven segment drive output terminals; set the number of display digit for FM (100kHz) and AM (1kHz) reception
14	Vcc	Power source terminal
28	Gnd	Ground

7. Muting circuit

The muting circuit operates in the following cases.

1. While pin 28 of the controller IC outputs the high level, Q207 and Q208 are turned on and muting is closed in the following cases: (1) While the manual UP/DOWN switch is being held down, (2) When a station in the memory is recalled, and (3) While a radio station is being received using auto search tuning.
2. When an FM station is not being received (and the muting switch is on). The IF level in the FM IF system (set at R120 so muting is opened at 17 dBf (low position)) and zero point detection circuit (tuning point 55kHz (100kHz step): 30kHz

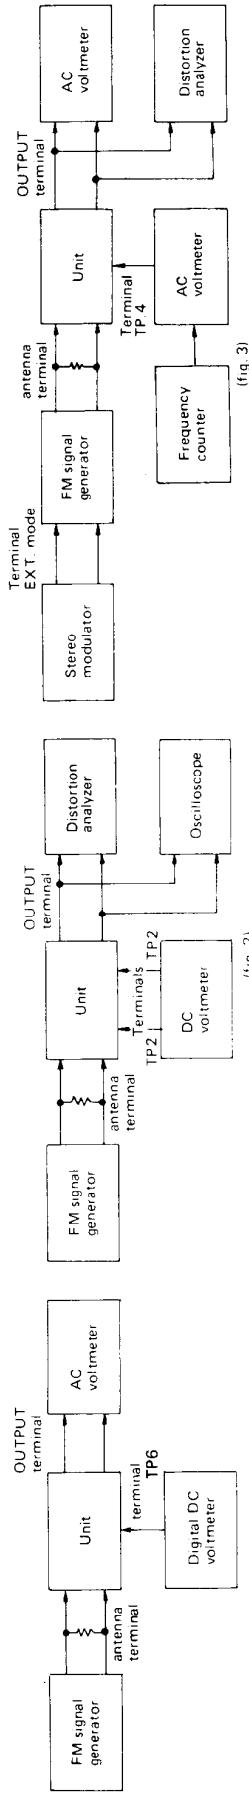

(50kHz step)— are output at pin 12 through the AND circuit. When a station is tuned, the output goes to the low level.

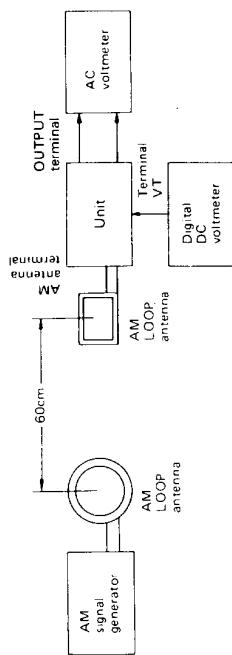

When output goes to the low level, Q109 is turned off, Q110 is turned on and Q207 and Q208 are turned off, so muting is opened. At the same, pin 16 of stereo decoder Q201 goes to the low level, so the VCO oscillator starts.

ADJUSTMENT PROCEDURES

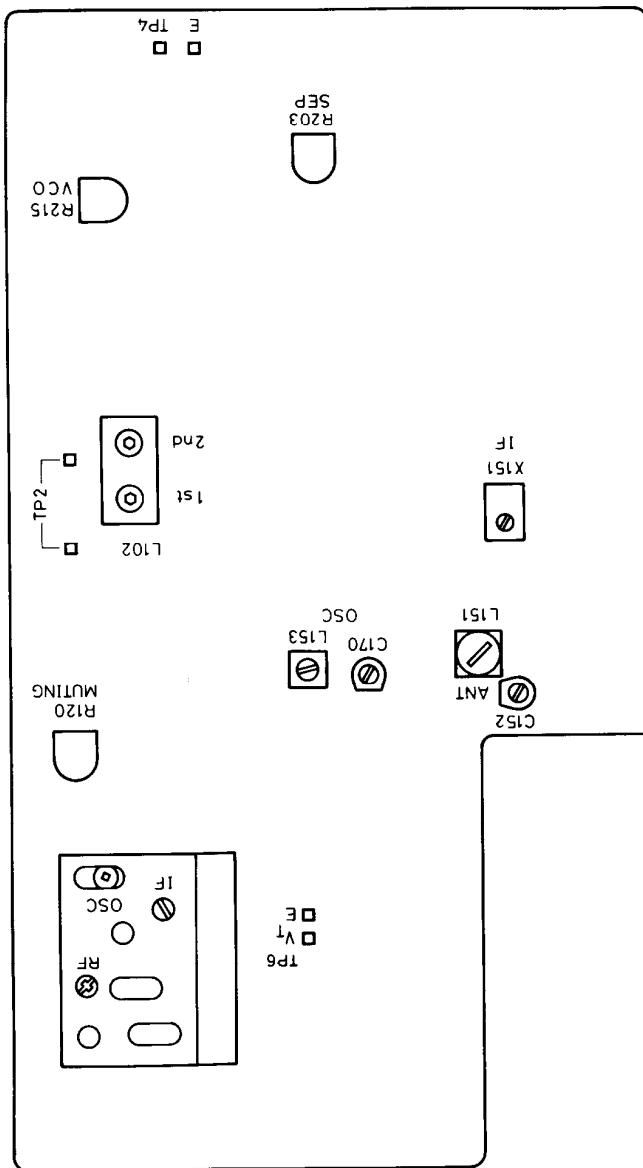

FM section

Item	Step	Connection of instrument	FM SG output	Stereo modulator output	Turning dial setting	Output indicator	Adjustment	Adjust for	Remarks
FM RF	1	Fig. 1	—	—	88.0 MHz	Digital DC voltmeter	OSC	1.4V	Usually not necessary to adjust.
