

STEREO AMPLIFIER

SA-7700

SA-706

SERVICE MANUAL

 PIONEER®

Both Model SA-7700 and Model SA-706 have the same basic performance. The major difference is in appearance, Model SA-7700 being fitted with wooden side and top panels, while Model SA-706 employs metal. The following table is displayed on the SA-7700 and the SA-706.

MODEL SA-7700

Type	Voltage	Remarks
KU	120V only	U.S.A. model
KC	120V only	Canada model

MODEL SA-706

Type	Voltage	Remarks
HG	220V and 240V (Switchable)	Europe or Oceania model
S	110V, 120V, 220V and 240V (Switchable)	General export model
S/G	110V, 120V, 220V and 240V (Switchable)	U.S. Military model

This service manual is applicable to the SA-7700/KU. When repairing the SA-706, please see the additional service manual (pp. 35-49). When repairing the SA-7700/KC, please see page 34.

Amplifier Section

Circuitry	1-st stage current mirror loaded differential amplifier, constant current loaded all-stage direct-coupled OCL.
---------------------	--

Continuous power output is 60watts* per channel, min., at 8ohms from 20Hertz to 20,000 Hertz with no more than 0.04% total harmonic distortion.

Total Harmonic Distortion (20Hertz to 20,000Hertz, from AUX)

continuous rated power output . . .	No more than 0.04%
30 watts per channel power output, 8 ohms	No more than 0.03%
1 watt per channel power output, 8 ohms	No more than 0.03%
30 watts per channel power output, 8 ohms	No more than 0.02%
1 watt per channel power output, 8 ohms	No more than 0.02%

Output

Speaker	A, B, A+B
-------------------	-----------

Damping Factor

(20Hertz to 20,000Hertz, 8 ohms)	40
--	----

Input (Sensitivity/Impedance)

PHONO	2.5mV/50 kilohms
TUNER	150mV/50 kilohms
AUX	150mV/50 kilohms
TAPE PLAY 1	150mV/50 kilohms
TAPE PLAY 2	150mV/50 kilohms

Phono Overload Level (T.H.D. 0.01%, 1kHz)

PHONO	180mV
-----------------	-------

Output (Level/Impedance)

TAPE REC 1	150mV
TAPE REC 2	150mV

Frequency Response

PHONO (RIAA Equalization)	20Hz to 20,000Hz±0.2dB
TUNER, AUX, TAPE PLAY	20Hz to 40,000Hz±2dB

Tone Control

BASS	+12dB, -10dB (100Hz)
TREBLE	+10dB, -10dB (10kHz)

Loudness Contour (Volume control set at -40dB position)
..... +6dB (100Hz), +3dB (10kHz)

Hum and Noise (IHF, short-circuited, A network)
PHONO . . . 86dB (Phono interference filter switch off)
TUNER, AUX, TAPE PLAY 95dB

Miscellaneous

Power Requirements	120V 60Hz
Power Consumption	180W(UL), 380VA(CSA), 520W(max.)
Dimensions	450(W)x148(H)x329(D) mm 17-3/4(W)x5-13/16(H)x12-15/16(D) in
Weight	Without package; 11.1kg(24 lb 7 oz) With package; 12.3kg(27 lb)

Specifications and the design subject to possible modification without notice due to improvements.

2. CONNECTION DIAGRAM

3. FRONT PANEL FACILITIES

POWER METERS

These power meters allow you to read out the rated power level when speakers with a nominal impedance of 8-ohms are connected to the amplifier's speaker terminals.

NOTE:

These values are related to the impedance of the speakers and they vary according to the frequency. In order to find out the exact output level, connect an 8-ohm dummy load instead of the speakers.

PEAK POWER INDICATORS

These lamps light up when the amplifier's output is at its peak level with 8 ohms load. Turn the VOLUME control to a lower position until the indicator does not light up continuously but only intermittently.

BASS, TREBLE CONTROLS

Adjust the bass with the BASS control and the treble with the TREBLE control. The bass and treble are strengthened when the controls are turned to the right and weakened when turned to the left.

The sound quality of the music source depends on how the sound is absorbed and reflected in the listening room and also on the characteristics of the speakers. You can use these controls to compensate accordingly and adjust the sound to your preference.

POWER SWITCH

Flip this switch to the ON position to supply power to the stereo amplifier. There will be a short delay when it is set to ON, because the muting circuit has been actuated to suppress the unpleasant noise that is sometimes generated when the power is switched on and off.

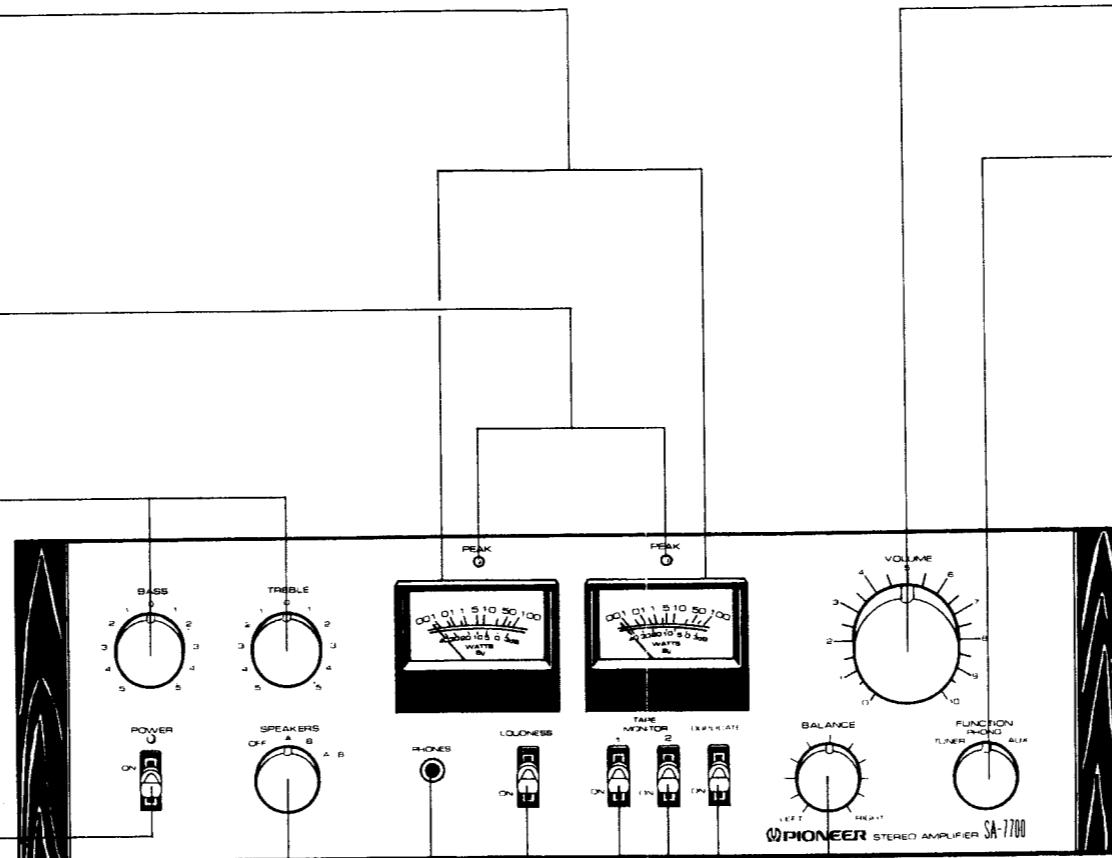

SPEAKERS SWITCH

Selects speaker system operation.

- OFF: Sound not obtained from speakers (when using headphones).
- A: Sound obtained from speakers connected to A speaker terminals.
- B: Sound obtained from speakers connected to B speaker terminals.
- A + B: Sound obtained from speakers connected to both A and B speakers terminals.

NOTE:

When listening with headphones or to temporarily interrupt the speaker sound, set switch to OFF or to an unused speaker position.

PHONES JACK

When listening with stereo headphones, connect them to this jack.

NOTE:

Set the SPEAKERS switch to OFF when listening only with headphones.

LOUDNESS SWITCH

Set this switch to ON when listening at a low volume. The frequency response of the human ear varies according to the listening volume, and setting this switch to the ON position compensates for hearing response by emphasizing the bass and treble.

TAPE DUPLICATE SWITCH

Set this switch to ON when you want to duplicate or edit a pre-recorded tape using two tape decks.

TAPE MONITOR SWITCHES (1, 2)

Set switch 1 to ON with a tape deck which is connected to the TAPE 1 jacks (REC and PLAY) when you want to monitor the playback or recording of a tape. The tape on a deck which is connected to the TAPE 2 jacks (REC and PLAY) can be similarly monitored by setting switch 2 to ON.

NOTE:

Set these switches to the upper (off) position when listening to records or a radio broadcast.

VOLUME CONTROL

Use this control to adjust the output level to the speakers and headphones. Turn it clockwise to increase the output level.

FUNCTION SWITCH

Selects desired playback source.

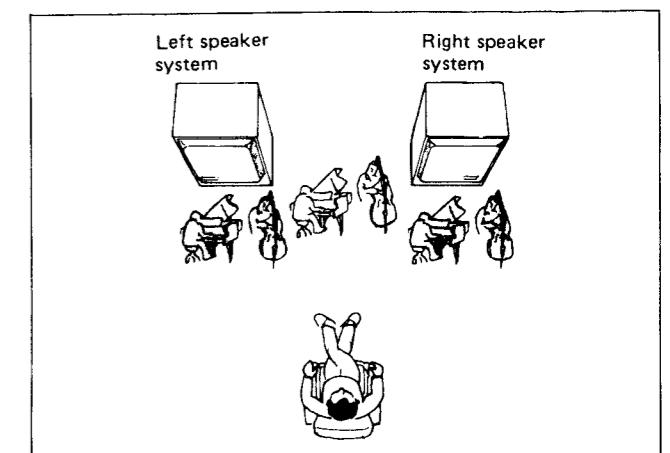

TUNER: To listen to broadcasts with a tuner connected to the TUNER jacks.

PHONO: To play records on a turntable connected to the PHONO jacks.

AUX: To play a component connected to the AUX jacks.

NOTE:

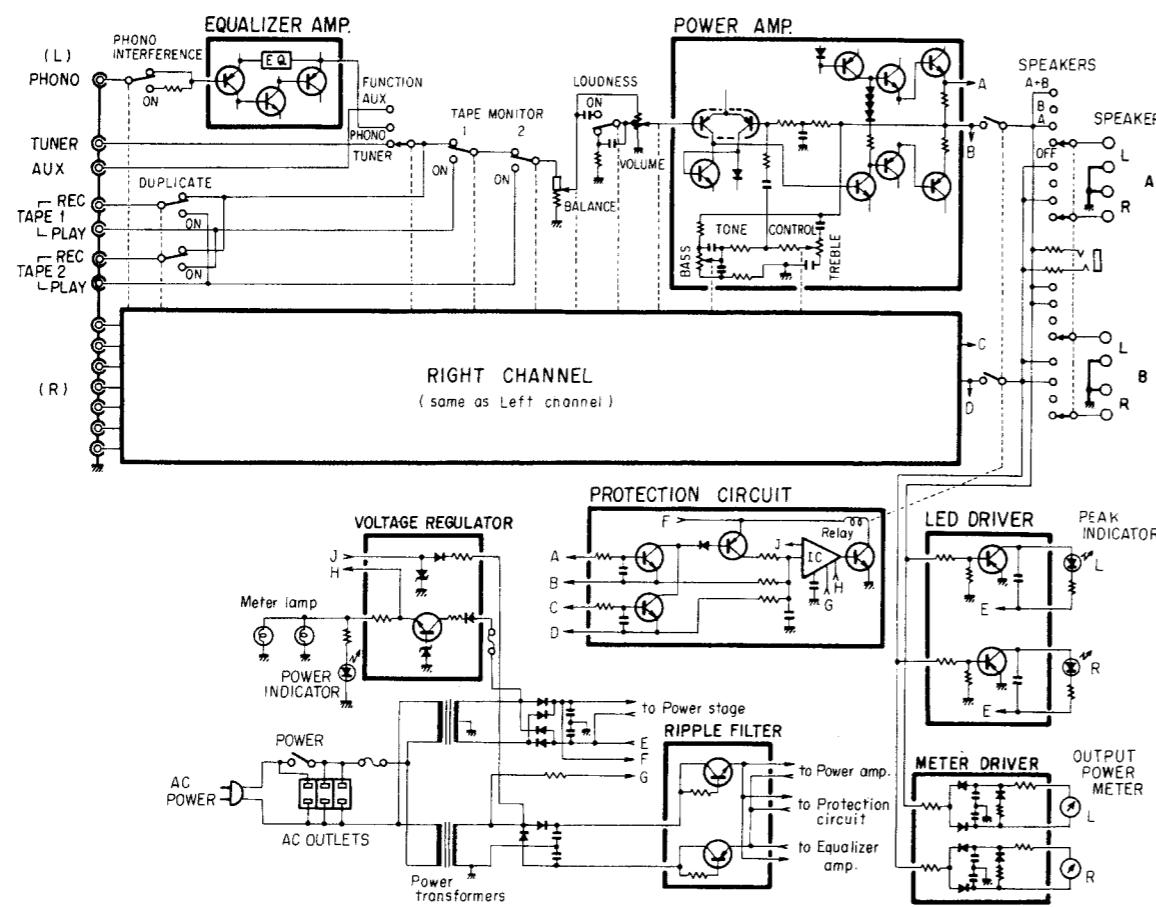

Turn the VOLUME control down first before selecting a different function switch while the sound from one program source is being reproduced.

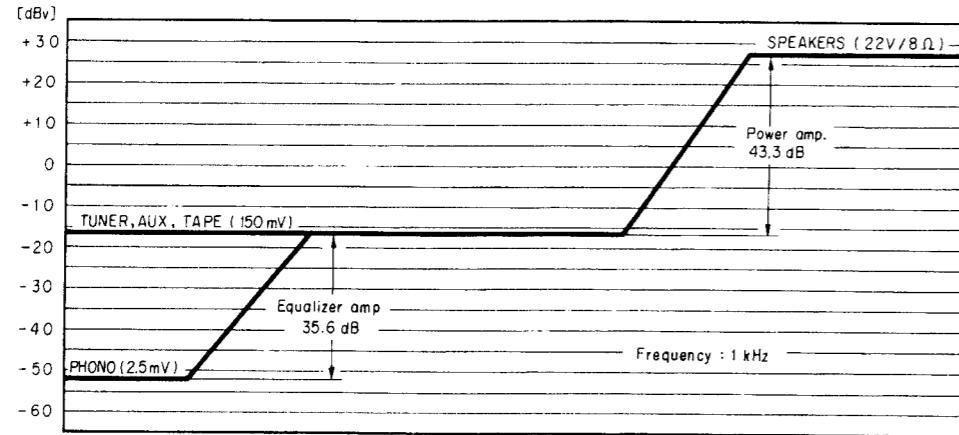

BALANCE CONTROL

Use this control to balance the volume of the left and right channels. First, however, tune the AM broadcast, and adjust so that the sound appears to come from somewhere exactly between the two speakers. If the sound appears to be louder on the right, it means that the volume of the right channel is higher. Turn the BALANCE control to the left and adjust. Conversely, if the sound appears to be louder on the left, it means that the volume of the left channel is higher. Therefore, turn the BALANCE control to the right and adjust.

4. BLOCK DIAGRAM

5. LEVEL DIAGRAM

6. CIRCUIT DESCRIPTIONS

6.1 PHONO CIRCUIT

Phono Interference Filter

Since the phono input circuit is extremely sensitive, it is adversely affected by radio frequency interference. This interference is reduced by inserting a resistor in series with the phono input circuit by setting the PHONO INTERFERENCE FILTER switch on the rear panel to the ON position.

Equalizer Amplifier

The equalizer amplifier is a 3-stage direct-coupled amplifier with emitter-to-emitter feedback (Fig. 6-1). An S/N ratio of 85dB (at 2.5mV input, IHF-A, PHONO INTERFERENCE FILTER switch OFF) has been achieved by using a new ultra-low-noise PNP transistor (2SA978) at the first stage, and reducing the signal source resistance and equalizer element impedance.

The 2nd stage load has been reduced, a large output voltage obtained, and the output impedance lowered by using an emitter follower at the output stage.

Metal film resistors having a tolerance of $\pm 1\%$ and polypropylene film capacitors and polystyrene film capacitors having a tolerance of $\pm 2\%$ are used in the NFB circuit to obtain an equalizer deviation of within $\pm 0.2\text{dB}$ over the $20\text{Hz} \sim 20\text{kHz}$ range. The maximum allowable input of this circuit is 180mV (at 1kHz, THD 0.01%).

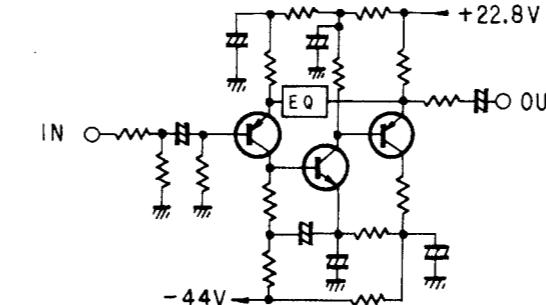

Fig. 6-1 Basic circuit of equalizer amplifier

6.2 POWER AMPLIFIER

The power amplifier is an 8-transistor (one of which is a dual transistor) all-stage direct-coupled pure complementary OCL circuit (Fig. 6-2).

Tone control (BASS, TREBLE) is accomplished by providing the power amplifier NFB circuit with a frequency selective characteristic. Since the number of elements through which the signal passes is small, this system is advantageous from the standpoints of distortion, noise, and cost. On the other hand, high gain and ample stability are demanded of the power amplifier.

The first stage of the power amplifier is a dual-transistor (Q_1) differential amplifier with a current mirror (Q_2, D_1) as its load circuit. The current mirror serves to make this stage operate in push-pull mode, thereby cancelling the even number harmonics.

A high voltage gain is obtained at the predriver stage (Q_3) by making its load circuit a constant-current source (Q_4, D_2).

The power stage ($Q_5 \sim Q_8$) is a 2-stage Darlington-connection SEPP circuit, and has an output of 60W (8Ω load, at both channels driven, THD 0.04%, 20Hz ~ 20kHz).

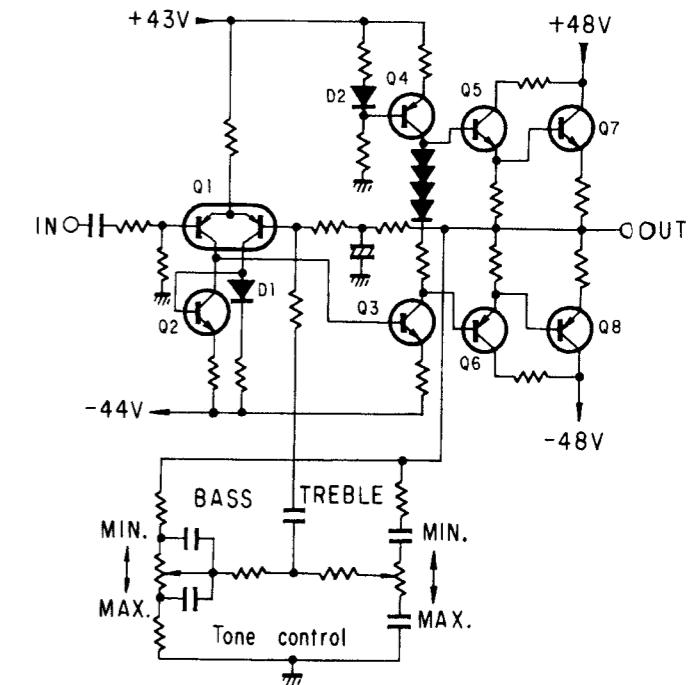

Fig. 6-2 Basic circuit of power amplifier

6.3 OUTPUT METER DRIVE CIRCUIT

This unit has an output meter that permits direct reading of an output from 0.01W to 100W at an 8Ω load without range switching.

The meter drive circuit is illustrated in Fig. 6-3. The output signal of the power amplifier is rectified by D_1 , D_2 , C_1 and C_2 through R_1 . The rectified signal is applied to the meter circuit (M , VR_1) and shunt circuit (R_2 , D_3). When the signal level is extremely low, D_3 is nonconductive, and all the signal current flows in M and VR_1 . D_3 begins to conduct as the signal level increases, and part of the signal current flows in R_2 and D_3 . The percentage of this shunt current increases as the signal level becomes higher. This keeps the increase in the signal current flowing in M and VR_1 smaller than the increase in the actual signal current. Therefore, 0.01W to 100W can be indicated on a single range.

There are two output meter indications, WATTS/ 8Ω and dB. The lower limit of the dB scale is -40dB. The conversion output at this time is 0.005W/ 8Ω .

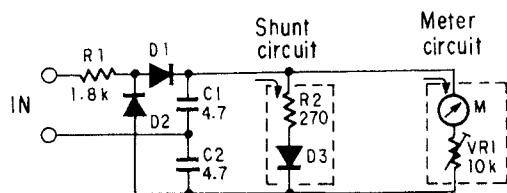

Fig. 6-3 Meter drive circuit

6.4 PEAK INDICATOR CIRCUIT

This circuit indicates clipping by saturation of the power amplifier. Basically, it lights an LED (light emitting diode) by sensing the output signal voltage of the power amplifier. (Fig. 6-4)

The output signal of the power amplifier is divided by R_1 and R_2 , and applied to the base of Q_1 , a PNP transistor. This transistor is turned ON by the minus peak of the signal, current flows in the LED and light is generated.

NOTE:

Since this circuit is untuned, its operating level varies, but it is operated by the following standards:

- Not lighted by a 50W output into an 8Ω load.
- Lighted by a 72W output into an 8Ω load.

6.5 PROTECTION CIRCUIT

The purpose of this circuit is to protect both the speakers and the power amplifiers. The relay in the output circuit is automatically opened in any of the following cases:

1. During the "transient operations" when the power supply is turned on and off.
2. Upon detection of an overload, caused by a short circuit in the load.
3. Upon detection of a DC voltage in the output circuit, caused by component failure or accident.

An outline of this circuit is shown in Fig. 6-5. The relay-activating transistor (Q_r) is controlled by the IC (PA3004).

Muting Operation When Power Supply is Tuned Off and On (Fig. 6-5)

When the power supply is first turned on, the voltages on pins 1, 7, and 6 of PA3004 will exceed a prescribed level. If there is no input (DC) on pin no.4, S_2 will be off, and a charging current will commence to flow to the timing capacitor (C_t) connected to pin no.8. Once C_t has been charged up to a level where the voltage on pin no.8 exceeds a prescribed level, S_1 will turn on, thereby applying a bias current from pin no.3 to the relay driving transistor (Q_r). Consequently, Q_r will turn on and current will flow through the relay coil to activate the relay, and close the connection in the output circuit. The time required for this connection to close after the power supply is first turned on is several seconds. During this period, any unwanted transient noises will be therefore muted.

When the power supply is turned off, the input (AC) applied to pin no.7 ceases immediately, resulting in S_2 turning on, C_t discharging rapidly, and S_1 and Q_r both turning off. The relay is thus opened, disconnecting the output circuit.

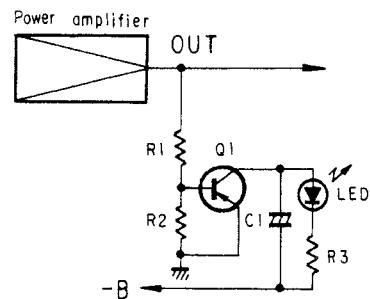

Fig. 6-4 Peak indicator circuit

DC Voltage Detector (Fig. 6-5)

The output circuit is connected to pin no.4 via a low-pass filter (R_8 and C_2). Any DC voltages appearing in the output circuit will also be applied to pin no.4, turning S_2 on. C_t will thus discharge rapidly, turning S_1 and Q_r off, thereby releasing the relay, and disconnecting the output circuit from the load.

Overload Detection

The overload detector circuit incorporates the load (RL) in one side of a Wheatstone bridge (see Fig. 6-6). The base and emitter of a sensing transistor (Q_1) are connected to the opposite corners of the bridge, so if RL decreases, Q_1 will become forward biased. If RL falls below a prescribed value, Q_1 will turn on, thereby passing a current through R_6 , R_5 and D_3 . Due to the voltage difference generated across R_6 , Q_2 will become forward biased, and consequently turn on. A DC voltage will then be applied to pin no.4, turning S_2 on, and resulting in the rapid discharge of C_t , and S_1 and Q_r both turning off. The relay will again be released to disconnect the output circuit.

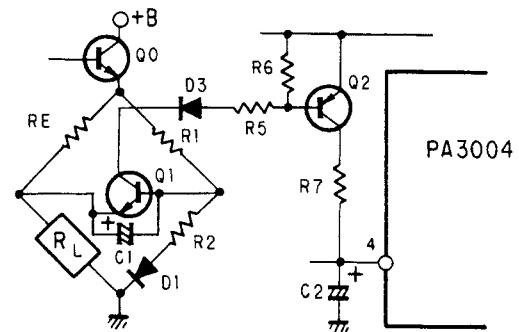

Fig. 6-6 Overload detector

6.6 POWER SUPPLY CIRCUIT

DC power is supplied by using two power transformers: one for the voltage amplifier stage and the other for the power stage. A bridge rectifier and a pair of $12,000\mu\text{F}$ capacitors supply $\pm 48\text{V}$ to the power stage. Power is supplied to the voltage amplifier stage through a full-wave voltage doubler rectifier and transistor ripple filter.

A transistor and Zener diode voltage regulator is used at the meter lamp power supply so that the meter illumination does not vary.

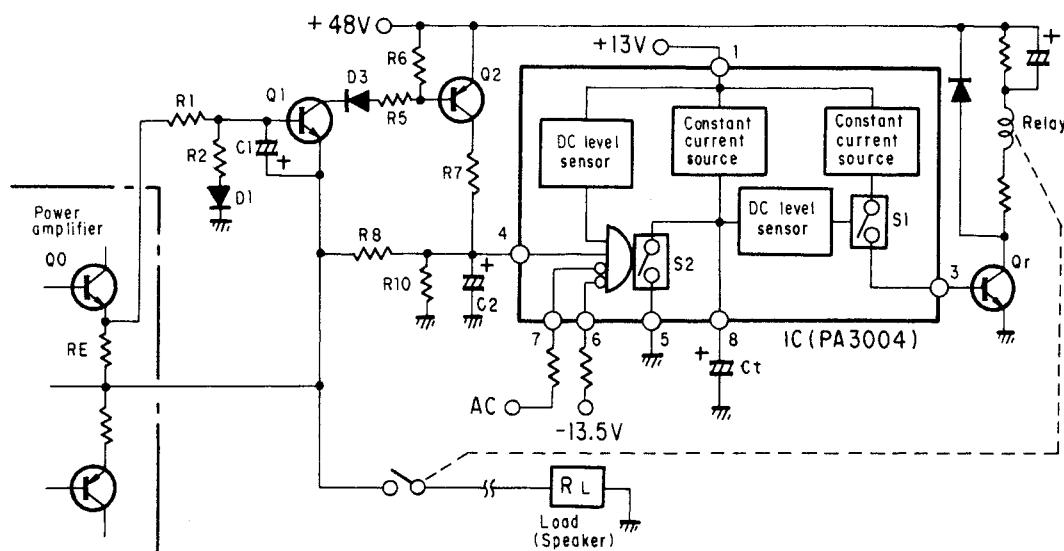

Fig. 6-5 Protection circuit

7. DISASSEMBLY

Top Cover (Side Panels, Top Plate)

Remove screws ① ~ ④, and remove the left and right-hand side panels.

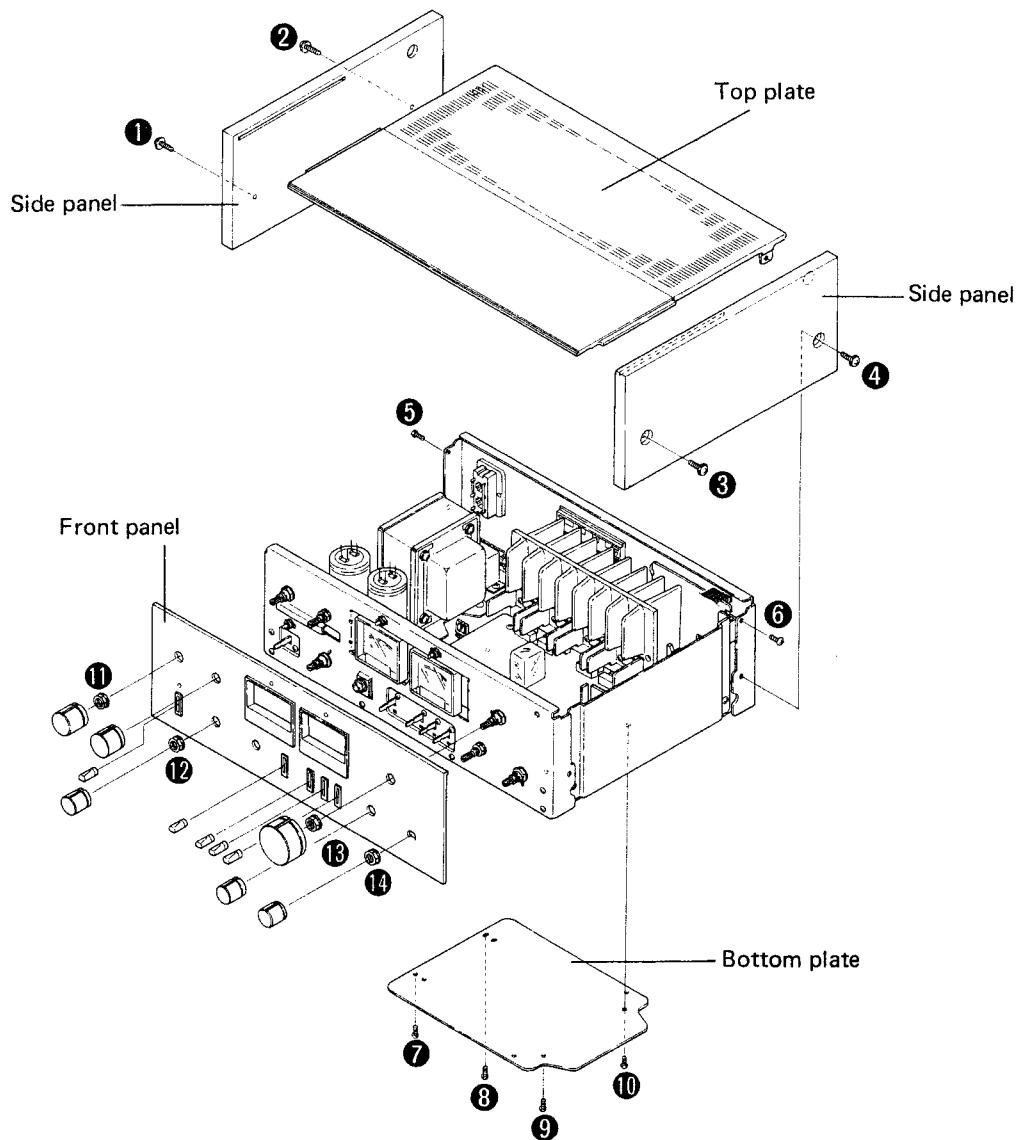

Remove screws ⑤, ⑥, and remove the top plate.

Bottom Plate

Remove screws ⑦ ~ ⑩

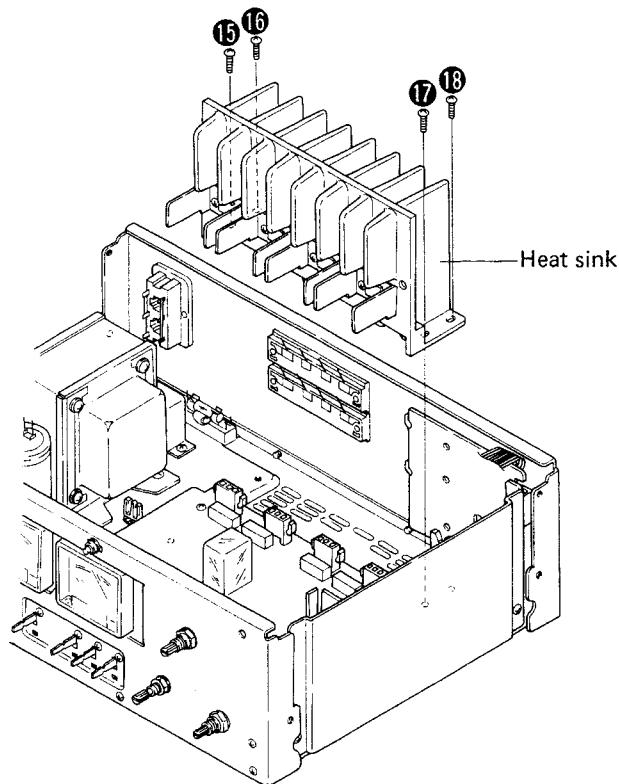

Front Panel

1. Pull off all the knobs.
2. Remove the nuts ⑪ ~ ⑭
3. Pull the front panel forward and remove.

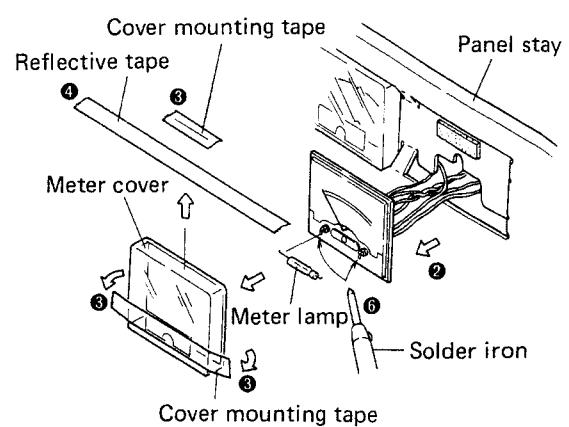

Heat Sink

Remove screws ⑯ ~ ⑰

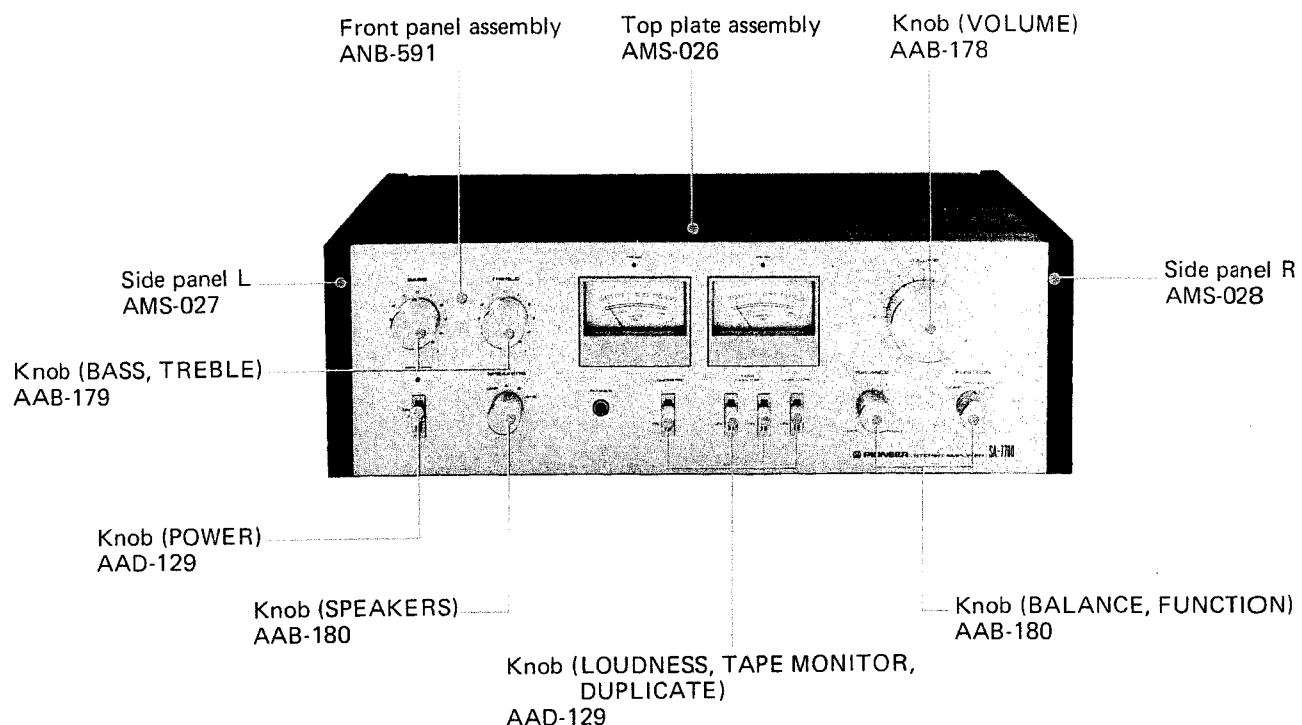

Meter Lamp Replacement

- (1) Remove the front panel.
- (2) Pull the meter from the body (the meter and panel stay are attached with double-sided adhesive tape through sponge).
- (3) Peel off the meter cover mounting tapes.
- (4) Peel off the reflective tape around the outside of the meter.
- (5) Remove the meter cover.
- (6) Remove the meter lamp, using a soldering iron.
- (7) Install the new lamp in the reverse order to removal.

9. ADJUSTMENTS

Idle Current Adjustment

1. Set the VOLUME control to the minimum position (fully counterclockwise).
2. Set the BASS and TREBLE controls to the flat (center) position.
3. Set the SPEAKERS selector to the A position, and connect an 8Ω resistor to the output terminals.
4. Connect a DC voltmeter to the TP terminals (L ch: 25(+), 22(-), R ch: 26(+), 28(-)) of the AF ass'y.
5. Adjust the semifixed resistor (L ch: VR₃₀₁, R ch: VR₃₀₂) for a reading of 40mV at the DC voltmeter.
6. Power the set for more than 10 minutes under this state, and confirm that the DC voltmeter reading is within the 10mV ~ 70mV range.

Output Meter Adjustment

1. Set the BASS and TREBLE controls to the flat (center) position.
2. Set the SPEAKERS selector to the A position, and connect an 8Ω resistor and AC voltmeter to the output terminals.
3. Set the FUNCTION switch to the AUX position, and apply a 1kHz, 150mV signal to the input terminals.
4. Adjust the VOLUME control for an AC voltmeter reading of 6.32V (5W + 5W output by driving both channels).
5. Adjust the semifixed resistor (L ch: VR₄₀₁, R ch: VR₄₀₂) for a reading of -10dB at the output meter under this condition.
6. Change the input signal level in 10dB steps with an attenuator, and confirm that the output meter indication nearly coincides with the attenuator change at the 0dB, -20dB, -30dB, and -40dB points.

12. PACKING

13. SUPPLEMENTS FOR MODEL SA-7700/KC

Model SA-7700/KU is the same as SA-7700/KC with exception of descriptions in this supplements.

Contrast of Miscellaneous Parts

Symbol	Description	Part No.		Remarks
		KU type	KC type	
T1	Power transformer	ATT-490	ATT-491	
FU3	Fuse 160mA	AEK-408	
C1	Ceramic 0.01 125V	ACG-003	ACG-014	
C2	Ceramic 0.01 250V	ACG-001	
	Ceramic 0.01 125V	ACG-014	
	Fuse holder	K91-008	for FU3
	Capacitor cover	AEC-279	AEC-365	for C1
	Capacitor cover	AEC-294	AEC-365	for C2
	Packing case	AHD-528	AHD-529	
	AF assembly	GWK-113	GWK-115	
	Tone & indicator assembly	GWX-167	GWX-173	
	Terminal assembly	GWX-165	GWX-171	
	VR assembly	GWX-164	GWX-170	
	RFI switch assembly	GWX-166	GWX-172	

AF ASSEMBLY (GWK-115)

The circuitry of the AF assembly GWK-115 is the same as the GWK-113 (for SA-7700/KU), with exception of the p.c. board material and the parts installation method.

TONE & INDICATOR ASSEMBLY (GWX-173)

The circuitry of the tone & indicator assembly GWX-173 is the same as the GWX-167 (for SA-7700/KU), with exception of the p.c. board material.

TERMINAL ASSEMBLY (GWX-171)

The circuitry of the terminal assembly GWX-171 is the same as the GWX-165 (for SA-7700/KU), with exception of the p.c. board material.

VR ASSEMBLY (GWX-170)

The circuitry of the VR assembly GWX-170 is the same as the GWX-164 (for SA-7700/KU), with exception of the p.c. board material.

RFI SWITCH ASSEMBLY (GWX-172)

The circuitry of the RFI switch assembly GWX-172 is the same as the GWX-166 (for SA-7700/KU), with exception of the p.c. board material.

Service Manual

STEREO AMPLIFIER

SA-706

HG,S,S/G

The basic performance of the Model SA-706 is the same as the Model SA-7700. SA-7700 has wooden side and top panels, while SA-706 employs metal (Fig. A). This additional service manual is applicable to the SA-706, please refer to the SA-7700 service manual with the exception of this supplements.

SPECIFICATIONS

The specifications for Model SA-706 is the same as Model SA-7700 except for following sections;

Amplifier Section

TAPE 2 (DIN connector, HG type only)

REC (Level/Impedance) 30mV/80 kilohms
PLAY (Sensitivity/Impedance) . . . 150mV/50 kilohms

Hum and Noise (DIN, continuous power/50mW)

PHONO..... 58dB/70dB
AUX..... 60dB/85dB

Miscellaneous

Power Requirements

Demensions 420(W)x147(H)x327(D)mm
16-9/16(W)x5-13/16(H)x12-7/8(D)in

Weight Without Package; 10.5kg (23lb 2 oz)
With Package; 11.7kg (25lb 13 oz)

Furnished Parts (S and S/G types)

Fuse 2.5A 1
Fuse 5A 1

SA-706/HG

SA-706/HG

AF ASSEMBLY (GWK-112)

The circuitry of the AF assembly GWK-112 is the same as the GWK-113 (for SA-7700/KU), with exception of the p.c. board material, the parts installation method and the size of fuse clip as follows:

Part Name	Part No. (for GWK-112)	Part No. (for GWK-113)
Fuse clip	AKR-010	AKR-013

TONE & INDICATOR ASSEMBLY (GWX-163)

The circuitry of the tone & indicator assembly GWX-163 is the same as the GWX-167 (for SA-7700/KU), with exception of the p.c. board material.

TERMINAL ASSEMBLY (GWX-161)

The circuitry of the terminal assembly GWX-161 is the same as the GWX-165 (for SA-7700/KU), with exception of the p.c. board material.

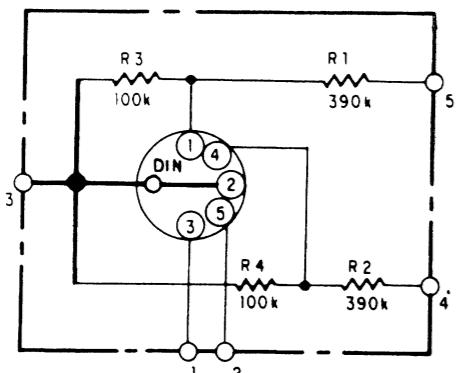

VR ASSEMBLY (GWX-160)

The circuitry of the VR assembly GWX-160 is the same as the GWX-164 (for SA-7700/KU), with exception of the p.c. board material.

RFI SWITCH ASSEMBLY (GWX-162)

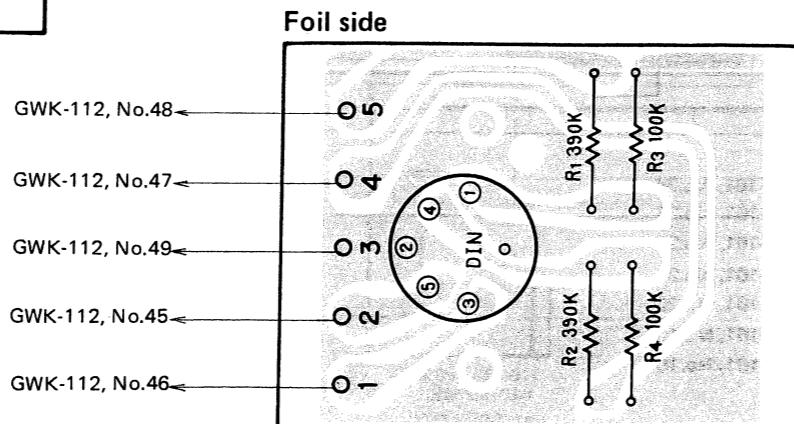

The circuitry of the RFI switch assembly GWX-162 is the same as the GWX-166 (for SA-7700/KU), with exception of the p.c. board material.

DIN CONNECTOR ASSEMBLY (AWX-137)

Parts List

Symbol	Part No.	Description
R1	RD1/PS 394J	Carbon film 390k
R2	RD1/PS 394J	Carbon film 390k
R3	RD1/PS 104J	Carbon film 100k
R4	RD1/PS 104J	Carbon film 100k
	AKP-011	5P connector socket (REC/PLAY)

AF ASSEMBLY (GWK-115)

The circuitry of the AF assembly GWK-115 is the same as the GWK-113 (for SA-7700/KU), with exception of the p.c. board material and the parts installation method.

TONE & INDICATOR ASSEMBLY (GDX-173)

The circuitry of the tone & indicator assembly GDX-173 is the same as the GDX-167 (for SA-7700/KU), with exception of the p.c. board material.

TERMINAL ASSEMBLY (GDX-171)

The circuitry of the terminal assembly GDX-171 is the same as the GDX-165 (for SA-7700/KU), with exception of the p.c. board mateiral.

VR ASSEMBLY (GDX-170)

The circuitry of the VR assembly GDX-170 is the same as the GDX-164 (for SA-7700/KU), with exception of the p.c. board material.

RFI SWITCH ASSEMBLY (GDX-172)

The circuitry of the RFI switch assembly GDX-172 is the same as the GDX-166 (for SA-7700/KU), with exception of the p.c. board material.
