2 • FRONT PANEL FACILITIES

POWER
Two positions, ON and OFF.

SPEAKER SWITCH

Speaker system selector switch

A: Sound is reproduced from the speaker system connected to the SPEAKER OUTPUT A socket.

OFF: Speakers stop sounding.

This position is selected when using a pair of stereo headphones.

B: The speaker system connected to the SPEAKER OUTPUT B socket is put in operation.

C: The speaker system connected to the SPEAKER OUTPUT C socket is put in operation.

A + B: The speaker systems connected to SPEAKER OUTPUT A and B sockets are put in operation.

A + C: The speaker systems connected to SPEAKER OUTPUT B and C sockets are put in operation.

PHONES JACKS

These phones jacks for stereo headphone(s).

The two jacks (1, 2) are available for connection with two stereo headphones.

BASS

Turn this knob to the right (clockwise) to increase bass tones, to the left (counterclockwise) to decrease them. Set the knob at its center position for flat response.

TREBLE

Use of this knob is similar to that of the BASS knob.

FILTER

LOW: Use this filter to cut out low-frequency interference, such as motor rumbling or hum.

HIGH: Use this filter to cut out high-frequency interference, such as that from fluorescent lights.

TUNING METERS

When selecting an AM broadcast, tune so that the dial pointer of the lower meter deflects as far to the right as possible.

For an FM broadcast, use the lower meter in the same way. Precision FM tuning is also possible by adjusting so that the dial pointer of the upper meter is centered.

TUNING

This knob is used to locate AM or FM stations. Watch the deflection of the pointer(s) of the tuning indicator for more precise tuning.

VOLUME

To increase the volume, turn it to the right (clockwise).

SELECTOR

This switch is for choosing the program source.

- | | |
|----------|--|
| AM: | AM reception |
| FM MONO: | FM monophonic reception only. |
| FM AUTO: | FM reception by automatic switching for either stereo or monophonic program. |
| PHONO 1: | For playing records on a turntable connected to the PHONO 1 terminals. |
| PHONO 2: | Same as above, for PHONO 2 terminals. |
| AUX 1: | For playing signals fed to the AUX 1 terminals. |
| AUX 2: | Same as above, for AUX 2 terminals. |
| MIC: | For reproduction through a microphone. |

MIC JACKS (L,R)

Connect the plug attached to the microphone lead to these jacks. A high-impedance, dynamic-type microphone with a standard plug should be used. A selection of high-performance dynamic microphones is available from Pioneer.

MODE SWITCH

Controls the stereo and mono output functions of the unit as follows:

- | | |
|--------------|---|
| REV: | Stereo, with right and left channel signals reversed. |
| STEREO NORM: | Normal stereo |
| LEFT: | Left channel signal fed to both left and right speakers. |
| RIGHT: | Right channel signal fed to both left and right speakers. |
| L + R: | Left and right channel signals mixed, then fed to both left and right channel speakers. |

BALANCE CONTROL

Used to adjust the stereophonic balance between left and right channels. Turning to the left strengthens the left channel sound; to the right, the right channel.

LOUDNESS

At reduced volume the ear's sensitivity to extremely low and high frequencies is reduced. This switch compensates for that phenomenon by emphasizing these frequencies. At normal or high volumes this switch should be kept off.

TAPE MONITOR SWITCHES (1 and 2)

These switches are set to ON for checking the recording conditions or for playback with tape decks.

1. This switch is set to ON for monitoring recording in progress or for playback with a tape deck connected to TAPE 1 MON terminals and TAPE 1 REC terminals or TAPE REC/P.B. connector.
2. This switch is set to ON for checking the recording conditions or for playback with a tape deck connected to TAPE 2 MON terminals and TAPE 2 REC terminals.

NOTE: For a record playback or listening to broadcasts, leave these switches set to the OFF position. With the switches set to ON, speakers will not operate.

FM MUTING

This switch is used to suppress much noise between FM stations when tuning. In a fringe area, however, this switch should be kept off because it may suppress the desired station signal at the same time.

MUTING SWITCH

Pushing this switch to the -20dB position decreases the volume by 20dB instantly. Setting it to the OFF position restores the volume to normal.

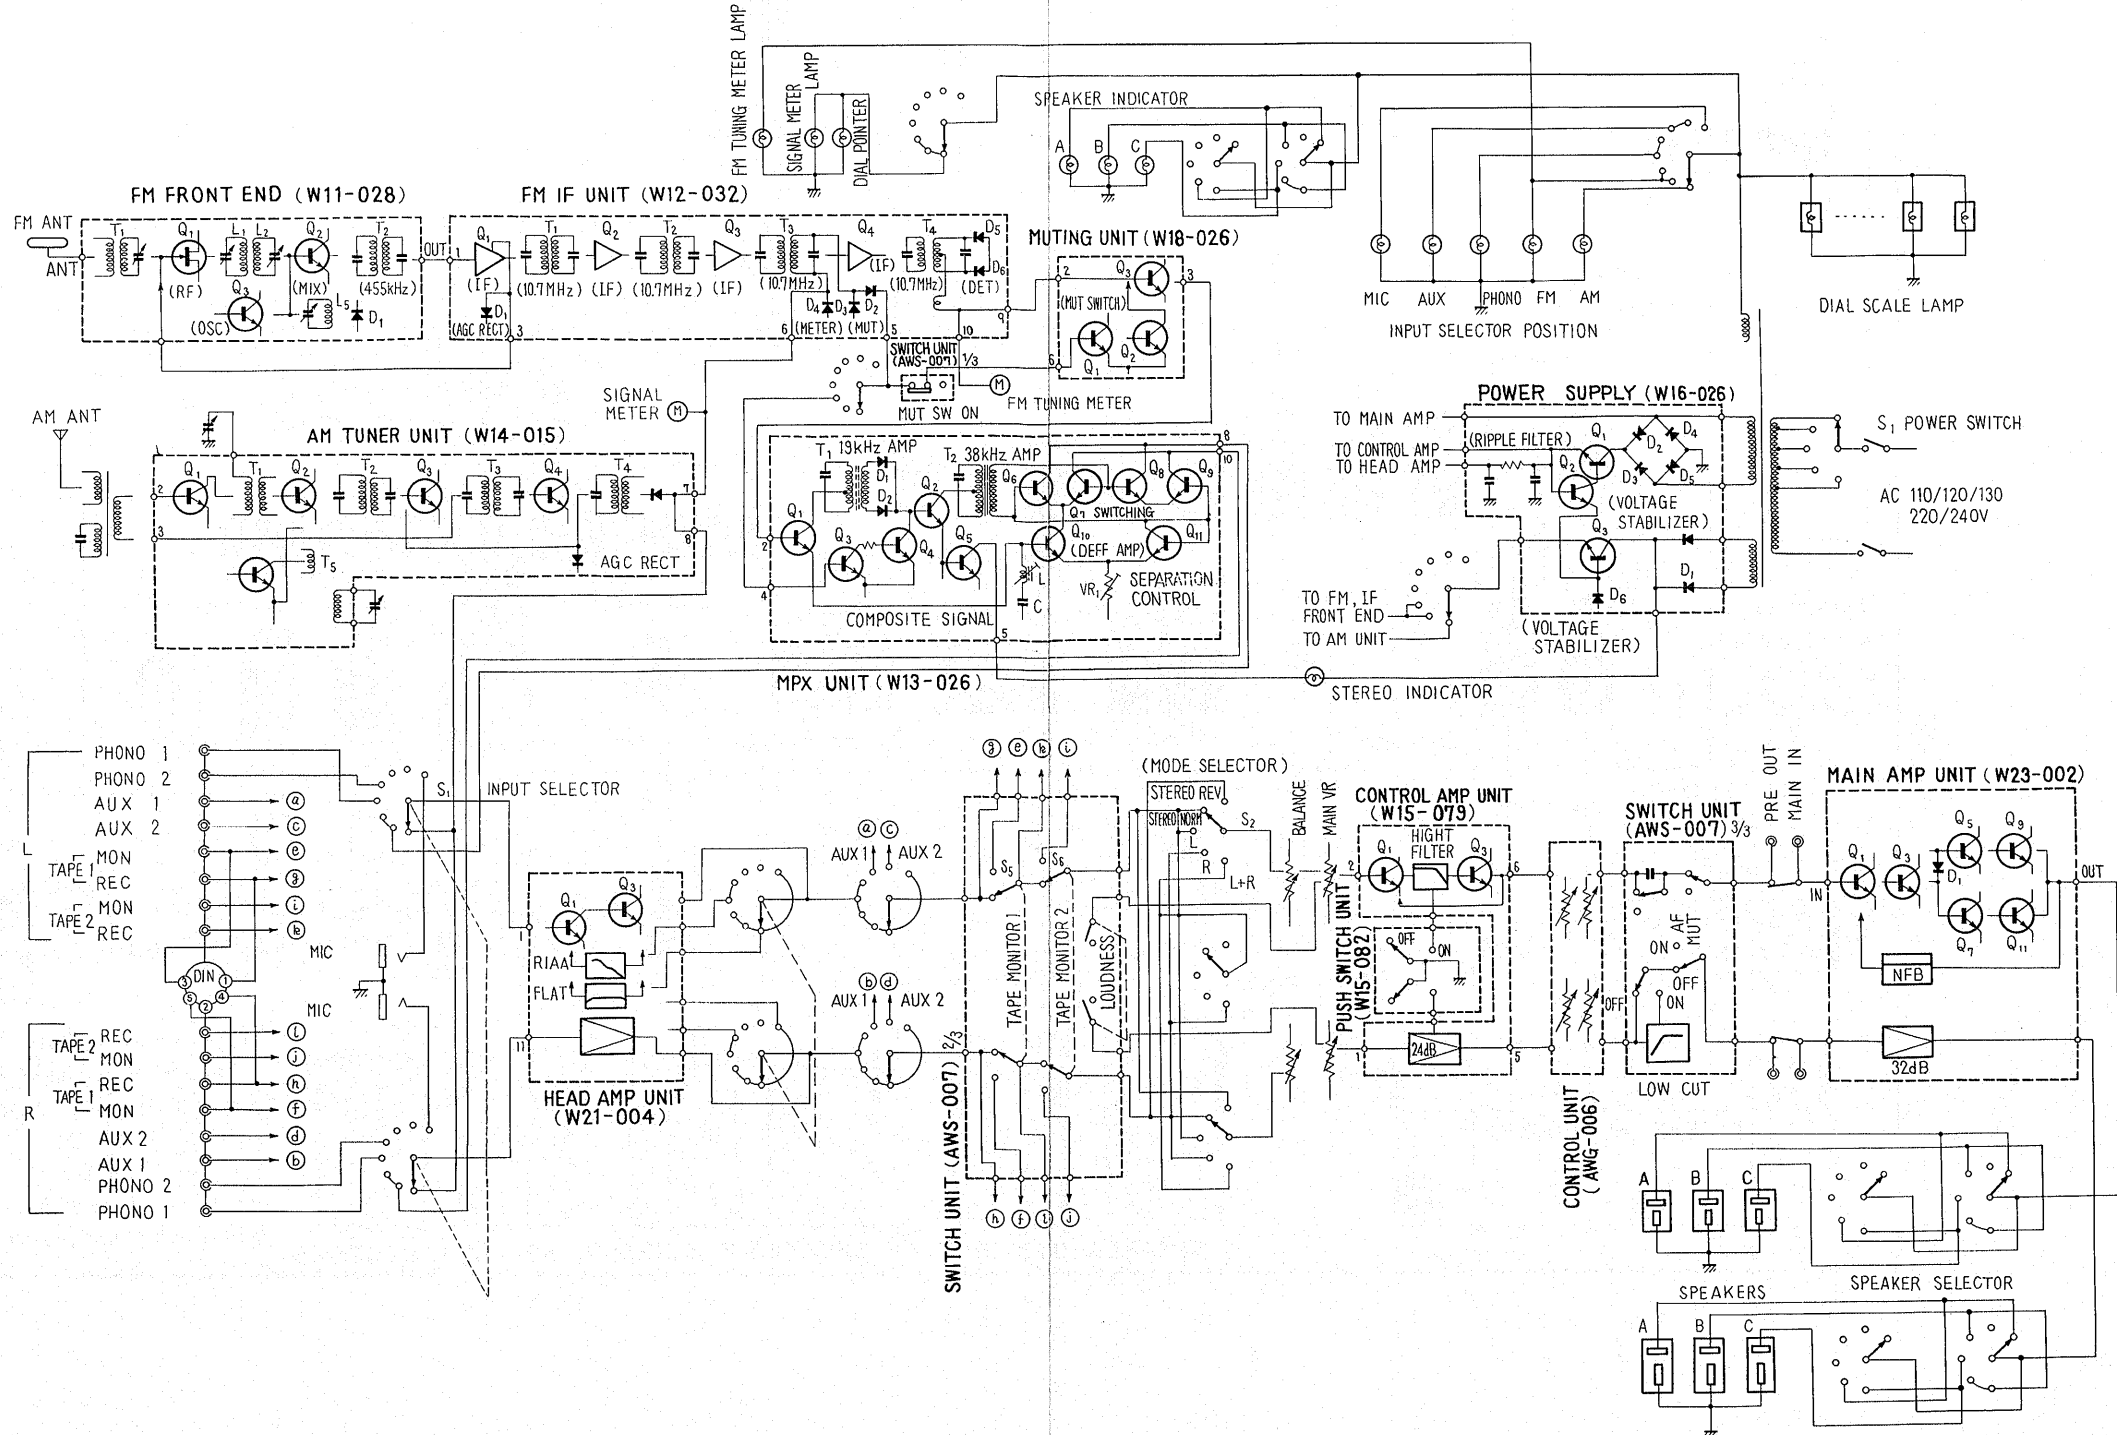

3 • CONNECTION DIAGRAM

4 • CIRCUIT DESCRIPTION

4.1 BLOCK DIAGRAM

As shown in the block diagram, SX-6000 comprises the following stages and circuits.

4-2 ANTENNA CIRCUIT

FM: The antenna signal enters the receiver through the antenna terminals of 300Ω (for ribbon-type antenna feeder) or 75Ω (for coaxial antenna cable).

AM: The ferrite loopstick antenna coil serves as inductance for the top tuning circuit.

4-3 FM FRONT END

The front end consists of a tuned RF amplifier Q1, converter Q2, and split-type heterodyne oscillator Q3. The oscillator frequency is varied from 98.2 to 118.7MHz and serves as source for the converter, Q2. There, the amplified 87.5 to 108MHz RF input signal is mixed with the 98.2 to 118.7MHz oscillator signal to produce an IF of 10.7MHz. The RF amplifier utilizes an FET (Q1), and AGC voltage is applied to the gate of Q1. This control voltage is obtained from the IF amplifier PCB through a rectifier circuit.

4-4 FM IF AMPLIFIER

The 10.7MHz output from T2 of the front end is supplied to the IC, Q1. The output from this amplifier goes to the next IC, Q2, and produces the AGC voltage at pin 3 through D1.

Q2 to Q4 and the tuned circuits of T2, T3 and T4 provide amplification and limiting of the 10.7MHz IF signal. The trigger voltage for the muting circuit detector output is taken from the 3rd stage (T3) output. The final stage on this circuit board is the discriminator, a ratio detector. Its output includes, in the case of an MPX stereo program, the L+R, L-R and 19kHz pilot signals.

4-5 MUTING CIRCUIT

This circuit consists of a Schmitt circuit Q1 and Q2, and a gate circuit Q3. Detector output from pin 5 of the IF PCB enters Q1 through the muting switch on the switch unit, PCB No. AWS-007.

When tuned, the detector output at pin 5 of the IF amplifier PCB has positive DC voltage, which makes Q1 conductive, depending on its potential.

This trigger voltage alternately switches the Schmitt circuit Q1 and Q2 on and off. This operation causes a voltage variation at the collector of Q2 and opens and closes the gate circuit Q3 when the muting switch is set to ON. The output of the gate circuit is taken from the collector side of Q3 because there is no output to the MPX circuit when Q3 is off. +12V enters the base of Q1 through muting switch and resistor, but the output from the Q3 when the muting switch is OFF.

4-6 MPX DECODER

The composite signal of an FM MPX broadcast, containing L+R, L-R and 19kHz pilot signals, is supplied from the muting PCB to Q1 of the MPX UNIT. This stage serves as a tuned amplifier for 19kHz and as an impedance changer to match the supplied signal to the switching circuit (Q6 to Q11). The primary winding of the collector side of Q1 is tuned to 19kHz, the secondary winding is connected to the full-wave rectifier D1, D2. The 19kHz pilot carrier is converted into a 38kHz ripple current of double frequency. Q4 operates as a class B amplifier for this 38kHz ripple signal, and a 38kHz tuned transformer eliminates harmonics from the 38kHz ripple signal, to obtain a clean sine wave for switching L and R. The Q2, Q3 circuit functions as a sensor that detects whether a broadcast is stereophonic or monophonic (when the selector switch is at FM AUTO position).

IC Q6 works as an amplifier to cancel out crosstalk. The 330Ω VR1 is for adjustment of channel separation.

The output from the switching circuit enters the audio amplifier section through a low pass filter.

4-7 AM TUNER

The AM tuner section employs one RF amplifier, a heterodyne oscillator, two 455kHz IF amplifiers and a detector. Except for the different frequency, the method of conversion to 455kHz IF is the same as in the FM front end.

AGC voltage, taken from the collector of Q4 through diode, is delivered to Q3 and back to Q2 converter base through Q1. Q1 operates as a DC amplifier to obtain sufficient AGC.

4-8 LOW LEVEL INPUT CIRCUIT

Low level signals such as outputs from phono cartridge or microphone are supplied into the PHONO 1 & 2 and MIC input jacks.

Program sources are selected by the input selector, S1.

4-9 HEAD AMPLIFIER

The head amplifier is contained on the W21-004 PCB, consisting of two voltage amplifiers. The overall negative feedback loop circuit for equalization is connected between the collector of Q3 and emitter of Q1.

Equalization characteristics are: RIAA playback for PHONO, flat response for microphone.

4-10 HIGH LEVEL INPUTS AND CONTROL CIRCUITS

High level inputs such as AUX 1 & 2 and radio reception are also selected by S1. Input from tape deck and recording output signal (a head amplifier output or a direct output from a high level input) are switched by TAPE MONITOR switches S5 and S6, respectively. The selected signal then passes to mode switch S2, balance and volume controls.

4-11 CONTROL AMPLIFIER, TONE CONTROLS AND FILTERS

This stage, consisting of two transistors, is embodied on PCB No. W15-079.

NFB is applied to the top stage transistor (emitter) to obtain stable, high impedance under all conditions. The output from the collector of Q1 passes to base of Q3 through 6dB/oct. high cut filter circuit. The output from Q3 passes to the tone controls and low cut filter circuits.

The tone control characteristics, i.e. treble boost and cut, bass boost and cut, are controlled by RC networks.

The low cut filter design uses switchable RC factors, and its characteristic is 6dB/oct.

4-12 POWER AMPLIFIER

The power amplifier circuit is assembled in PCB No. W23-002. It consists of six transistors (Q1, Q3, Q5, Q7, Q9 and Q11) for each channel. Overall NFB is applied from output to the emitter of Q1, thus improving distortion and frequency response. Transistors Q3, Q5, Q7, Q9 and Q11 are all direct coupled, stabilizing the circuit by applying NFB in both AC and DC. The thermistor against fluctuations of ambient temperature stabilizes temperature characteristics.

4-13 POWER SUPPLY

Q1 and Q2 are a voltage regulator, supplying low-ripple rectified current to the audio amplifier sections such as head amplifier and control amplifier.

The other regulated voltage for the tuner section (FM front end, FM IF amplifier, muting circuit, MPX decoder and AM tuner) is obtained from the other power transformer taps via a full-wave rectifier through voltage regulator Q3. All parts except the filter capacitor and power transformer are located on PCB No. W16-026.

5 • DISASSEMBLY

5.1 WOODEN CASE

Remove the 4 screws from the bottom of the wooden case. Pull the case backward off the receiver housing.

5.2 FRONT PANEL

Pull off all knobs, then remove nut and washer from shaft and remove 5 screws from front panel as illustrated in Fig. 1. The front panel can be removed.

5.3 BOTTOM PLATE

The bottom plate can be removed after loosening the 6 screws.

6 • DIAL CORD STRINGING

1. Set the tuning capacitor to minimum capacitance.
2. Tie one end of string on tuning pulley.
3. Pull string around small pulley (A), then fasten string to dial pointer.
4. Lead string around small pulley (B), then wind 3 turns around tuning shaft.
5. Lead string around small pulleys C and D, then return to tuning pulley.
6. Wind string $\frac{1}{2}$ turn around tuning pulley.
7. Finally, tie end of string to remaining side of spring on tuning pulley.
8. Tune receiver to high end. Fasten dial pointer to string so that it indicates high end on dial scale.

7 • ALIGNMENT PROCEDURES

The following alignments are required only in very rare cases and should never be attempted unless absolutely necessary. Only non-metallic tools must be used.

7.1 REQUIRED INSTRUMENTS

- Sweep generator
- Oscilloscope
- AC VTVM
- AM/FM signal generator.
- FM multiplex signal generator, preferably with RF output.

7.2 10.7MHz ALIGNMENT

- a) Set the SELECTOR switch to FM MONO position.
- b) Confirm +B voltage and current for 12V \pm 1V which should be 31mA to 44mA at pin 4 of the IF PCB.
- c) Disconnect lead from pin 1 (input).
- d) Connect 10.7MHz sweep generator to pin 1 (hot) and 2 (ground).
- e) Connect vertical scope input to pin 6.
- f) Align cores of T1, T2 and T3 for maximum gain and symmetry to obtain scope pattern as in Fig. 3.
- g) Raise generator output gradually to 80dB (10mV), repeat step (f) for each output level, if necessary.
- h) Disconnect one side of C20. Disconnect oscilloscope.
- i) Connect scope input to pin 10.
- j) Set generator output back to 55dB (500 μ V).
- k) Adjust bottom core of T4 for maximum gain and linearity.
Adjust top core so that center frequency mark is located on zero axis, as shown in Fig. 4.
- l) Reconnect C20.
- m) Reconnect input lead to pin 1.

Fig. 3

Fig. 4

7-3 FM FRONT END ALIGNMENT

- a) Set the SELECTOR switch to FM MONO position.
- b) Confirm +B current (drain 5mA -19mA).
- c) Connect FM signal generator output to 300Ω antenna input. Insert a 150Ω resistor in series with each lead, as shown in Fig. 5.
- d) Connect AC VTVM to either L or R of TAPE REC jacks on rear panel.
- e) Adjust generator for 400Hz, 100% modulation.
- f) Adjust generator frequency and tuning dial to 90MHz. During the following adjustments, keep the generator output as low as possible.
- g) Adjust L5 core first, then adjust cores of L1, L2, T1 for maximum reading on VTVM and so that tuning meter indicates center position.
- h) Set generator frequency and tuning dial to 106MHz.
- i) Adjust trimmer capacitor CT4 first, then adjust CT1, CT2, CT3 for maximum reading on VTVM and so that tuning meter indicates center position.
- j) Repeat these alignments several times until satisfactory readings are obtained.
- k) Finally, adjust T2 cores for maximum reading on VTVM.

From generator

To 300Ω Antenna terminals

Fig. 5

7-4 FM MPX DECODER ALIGNMENT

- a) Set SELECTOR switch on front panel to FM AUTO position.
- b) Connect RF output of FM multiplex signal generator to 300Ω antenna input, with a 150Ω resistor in each lead as shown in Fig. 5.
- c) Adjust MPX generator as follows: *vs:*

Signal mode	Deviation
L+R (main)	40.5kHz
19kHz (pilot)	7.5kHz
- d) Connect AC VTVM to TAPE REC jack on rear panel.
- e) Set generator signal mode to L-R (sub), adjust core of L1 (located on MPX PCB) to obtain maximum reading on VTVM.
- f) Set generator signal mode to L. Adjust VR1 (located on MPX PCB) for minimum crosstalk on R channel TAPE REC output.
- g) Set generator signal mode to R. Repeat above adjustment for minimum crosstalk on L channel.

7.5 AM 455kHz ALIGNMENT

- Set SELECTOR switch on front panel to AM position.
- Connect 455kHz sweep generator to test-point 12 through 0.1 μ F capacitor. Adjust generator output level to 60dB (1mV).
- Connect vertical oscilloscope input to TAPE REC jack.
- Set tuning dial to high end position.
- Adjust cores of T3, T4 and T5 for maximum gain and symmetrical pattern on oscilloscope.

7.6 AM TRACKING ALIGNMENT

- Set SELECTOR switch to AM position.
- For this alignment, bottom plate must be installed.
- Set signal generator to AM function, 30% modulation with 400Hz. Connect loop antenna to generator RF output and place near receiver's ferrite core antenna. See Fig. 6.
- Connect VTVM to TAPE REC jack.
- Keep generator as low as possible for minimum VTVM reading.
- Tune generator and receiver to 600kHz. Adjust core of T2 on AM circuit PCB for maximum VTVM reading, then adjust core of T1 and ferrite antenna.
- Re-tune generator and receiver to 1,400kHz.
- Adjust trimmers on variable capacitor indicated in Fig. 7 to obtain maximum VTVM reading.

Fig. 6

- Numbers indicate order of alignments.
