# Service Manual

ORDER NO.  
**CRT4485****MONAURAL POWER AMPLIFIER**

# **TAD-M600**

**THIS MANUAL IS APPLICABLE TO THE FOLLOWING MODEL(S) AND TYPE(S).**

Model	Type	Power Requirement	Remarks
TAD-M600	U	AC 120 V	
TAD-M600	Y5	AC 230 V	

For details, refer to "Important Check Points for good servicing".

**TECHNICAL AUDIO DEVICES LABORATORIES, INC.** 1-1, Shin-ogura, Saiwai-ku, Kawasaki-shi, Kanagawa 212-0031, Japan

# SAFETY INFORMATION

A

This service manual is intended for qualified service technicians ; it is not meant for the casual do-it-yourselfer. Qualified technicians have the necessary test equipment and tools, and have been trained to properly and safely repair complex products such as those covered by this manual.

■ Improperly performed repairs can adversely affect the safety and reliability of the product and may void the warranty. If you are not qualified to perform the repair of this product properly and safely, you should not risk trying to do so and refer the repair to a qualified service technician.

## WARNING

B This product may contain a chemical known to the State of California to cause cancer, or birth defects or other reproductive harm.

Health & Safety Code Section 25249.6 - Proposition 65

## NOTICE

(FOR CANADIAN MODEL ONLY)

■ Fuse symbols (fast operating fuse) and/or (slow operating fuse) on PCB indicate that replacement parts must be of identical designation.

## REMARQUE

(POUR MODÈLE CANADIEN SEULEMENT)

■ Les symboles de fusible (fusible de type rapide) et/ou (fusible de type lent) sur CCI indiquent que les pièces de remplacement doivent avoir la même désignation.

C

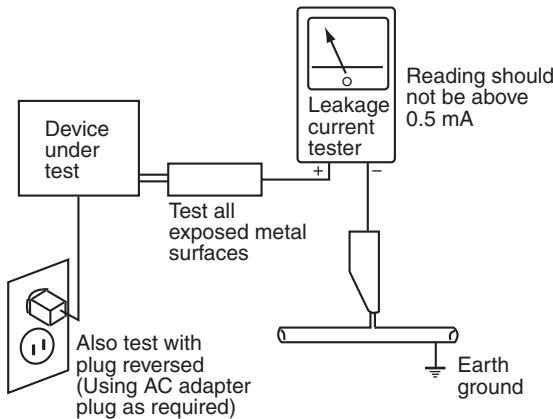

(FOR USA MODEL ONLY)

## 1. SAFETY PRECAUTIONS

The following check should be performed for the continued protection of the customer and service technician.

### LEAKAGE CURRENT CHECK

Measure leakage current to a known earth ground (water pipe, conduit, etc.) by connecting a leakage current tester such as Simpson Model 229-2 or equivalent between the earth ground and all exposed metal parts of the appliance (input/output terminals, screwheads, metal overlays, control shaft, etc.). Plug the AC line cord of the appliance directly into a 120V AC 60 Hz outlet and turn the AC power switch on. Any current measured must not exceed 0.5 mA.

ANY MEASUREMENTS NOT WITHIN THE LIMITS OUTLINED ABOVE ARE INDICATIVE OF A POTENTIAL SHOCK HAZARD AND MUST BE CORRECTED BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

## 2. PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in the appliance have special safety related characteristics. These are often not evident from visual inspection nor the protection afforded by them necessarily can be obtained by using replacement components rated for voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual.

Electrical components having such features are identified by marking with a on the schematics and on the parts list in this Service Manual.

The use of a substitute replacement component which does not have the same safety characteristics as the PIONEER recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, or other hazards.

Product Safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current PIONEER Service Manual. A subscription to, or additional copies of, PIONEER Service Manual may be obtained at a nominal charge from PIONEER.

## A [Important Check Points for Good Servicing]

In this manual, procedures that must be performed during repairs are marked with the below symbol.  
Please be sure to confirm and follow these procedures.

### 1. Product safety

Please conform to product regulations (such as safety and radiation regulations), and maintain a safe servicing environment by following the safety instructions described in this manual.

- ① Use specified parts for repair.

Use genuine parts. Be sure to use important parts for safety.

- ② Do not perform modifications without proper instructions.

Please follow the specified safety methods when modification(addition/change of parts) is required due to interferences such as radio/TV interference and foreign noise.

- ③ Make sure the soldering of repaired locations is properly performed.

When you solder while repairing, please be sure that there are no cold solder and other debris.  
Soldering should be finished with the proper quantity. (Refer to the example)

- ④ Make sure the screws are tightly fastened.

Please be sure that all screws are fastened, and that there are no loose screws.

- ⑤ Make sure each connectors are correctly inserted.

Please be sure that all connectors are inserted, and that there are no imperfect insertion.

- ⑥ Make sure the wiring cables are set to their original state.

Please replace the wiring and cables to the original state after repairs.  
In addition, be sure that there are no pinched wires, etc.

- ⑦ Make sure screws and soldering scraps do not remain inside the product.

Please check that neither solder debris nor screws remain inside the product.

- ⑧ There should be no semi-broken wires, scratches, melting, etc. on the coating of the power cord.

Damaged power cords may lead to fire accidents, so please be sure that there are no damages.  
If you find a damaged power cord, please exchange it with a suitable one.

- ⑨ There should be no spark traces or similar marks on the power plug.

When spark traces or similar marks are found on the power supply plug, please check the connection and advise on secure connections and suitable usage. Please exchange the power cord if necessary.

- ⑩ Safe environment should be secured during servicing.

When you perform repairs, please pay attention to static electricity, furniture, household articles, etc. in order to prevent injuries.  
Please pay attention to your surroundings and repair safely.

### 2. Adjustments

To keep the original performance of the products, optimum adjustments and confirmation of characteristics within specification.  
Adjustments should be performed in accordance with the procedures/instructions described in this manual.

### 3. Lubricants, Glues, and Replacement parts

E Use grease and adhesives that are equal to the specified substance.  
Make sure the proper amount is applied.

### 4. Cleaning

F For parts that require cleaning, such as optical pickups, tape deck heads, lenses and mirrors used in projection monitors, proper cleaning should be performed to restore their performances.

### 5. Shipping mode and Shipping screws

To protect products from damages or failures during transit, the shipping mode should be set or the shipping screws should be installed before shipment. Please be sure to follow this method especially if it is specified in this manual.

# 1. SERVICE PRECAUTIONS

## 1.1 NOTES ON SOLDERING

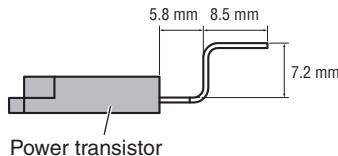

Compared with eutectic solders, lead-free solders have higher bond strengths but slower wetting times and higher melting temperatures (hard to melt/easy to harden).

The following lead-free solders are available as service parts:

- Parts numbers of lead-free solder:
  - GYP1006 1.0 in dia.
  - GYP1007 0.6 in dia.
  - GYP1008 0.3 in dia.

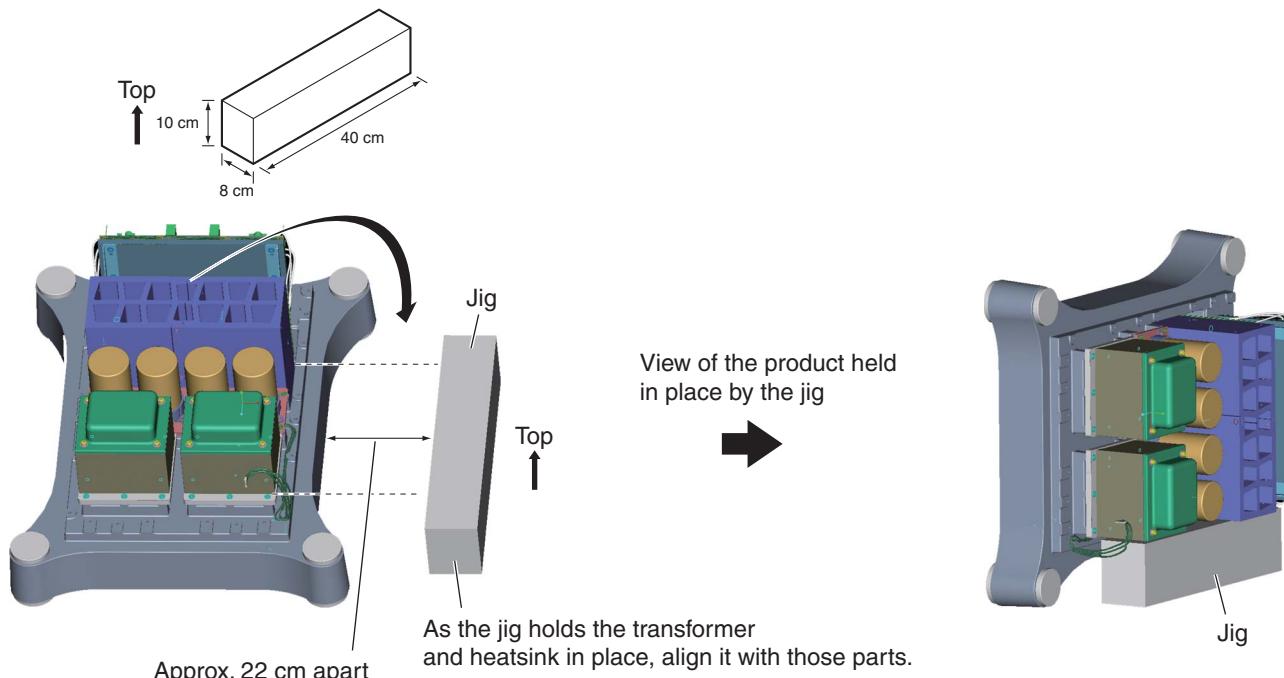

## 1.2 SERVICE PRECAUTIONS

- Be careful not to scratch or stain the cabinet during servicing, because it may cause a serious complaint.
- As the product weighs 90 kg, be fully careful when handling it. Four people are required when moving it.
- Be careful of the order of wire arrangement at a place where several wires are fixed together with a screw (on the power main electrolytic capacitor, etc.), as this can affect the sound quality.  
Follow the detailed procedure described in "7. DISASSEMBLY".
- As the product has conical feet, be very careful not to scratch floor surfaces in the customer's home.
- Leads of power transistors supplied as service parts are NOT bent like ones used on the product.  
Bend leads of supplied parts as shown the rough indication below before using.

## 1.3 FOR JIG

### Jig for the Product (Recommended Sizes) and How to Use the Jig

## 2. SPECIFICATIONS

### 2.1 SPECIFICATIONS

#### A ■ Amplifier Section

Power output .....	600 W (20 Hz to 20 kHz, T.H.D., 0.2 %, 4 Ω) 300 W (20 Hz to 20 kHz, T.H.D., 0.2 %, 8 Ω)
Rated distortion .....	Less than 0.03 % (20 Hz to 20 kHz, 300 W, 4 Ω)
Signal-to-Noise Ratio (IHF, short circuited, A network) .....	125 dB or higher
Frequency response .....	1 Hz to 100 kHz, +0 -1 dB
Gain.....	29.5 dB
Input terminal (Sensitivity/ Impedance) .....	1.5 V / 220 kΩ

#### B ■ Power section/miscellaneous

Power requirements .....	AC 120 V, 60 Hz (TAD-M600/U) AC 230 V, 50/60 Hz (TAD-M600/Y5)
Power consumption .....	520 W
Dimensions .....	516 mm (W) × 297 mm (H) × 622 mm (D) (20 5/16 in. (W) x 11 11/16 in. (H) x 24 1/2 in. (D))
Dimensions (When using spike bases) .....	516 mm (W) × 307 mm (H) × 622 mm (D) (20 5/16 in. (W) x 12 1/16 in. (H) x 24 1/2 in. (D))
Weight .....	90.0 kg (198.4 lb)

#### Note

- D ● Specifications and the design are subject to possible modifications without notice, due to improvements.

### Checking what's in the box

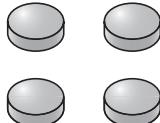

Please check that you have received the following supplied accessories in the accessory box.

- E ● Power cord x 1 (ADG7061: TAD-M600/U)  
(ADG7062: TAD-M600/Y5)      ● Hexagon wrench x 1 (CBX1012)

- Spike base template x 1  
● Operating Instructions (CRB3085: TAD-M600/U)  
(CRD4431: TAD-M600/Y5)

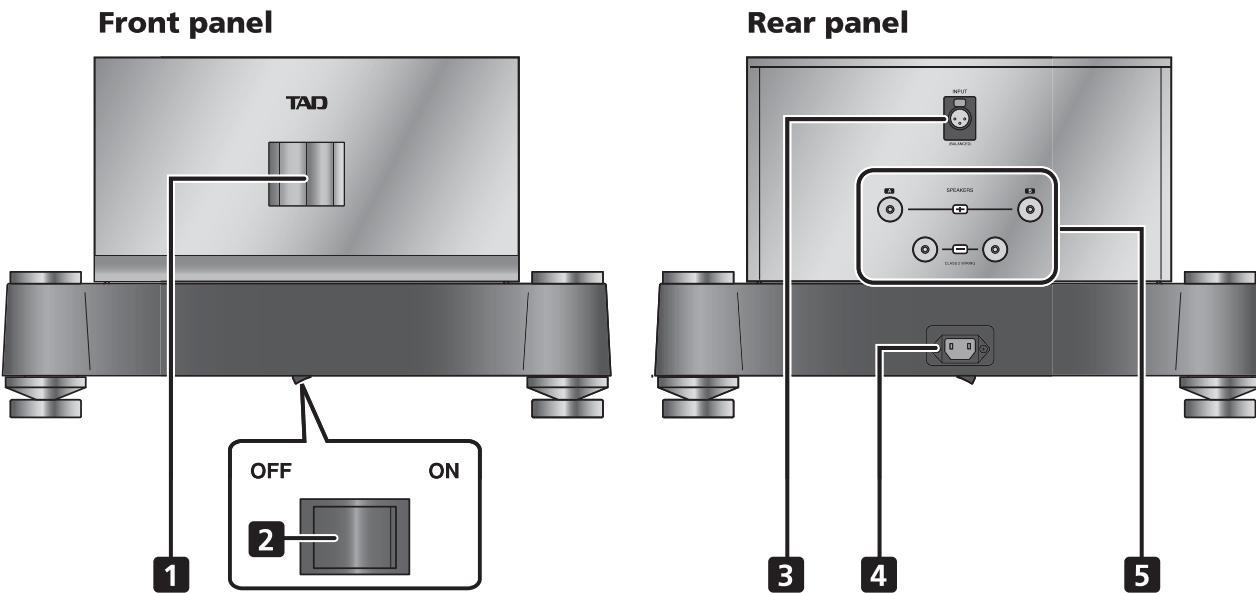

- Spike bases x 4

F

## 2.2 PANEL FACILITIES

### Controls and displays

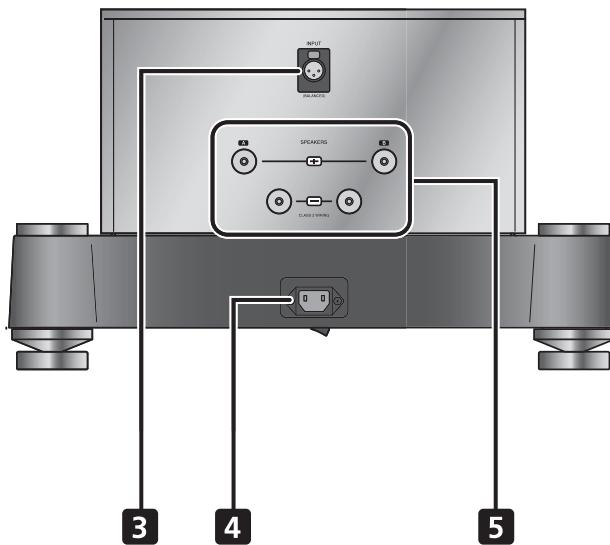

#### 1. Power indicator

Indicates whether the power is turned on or off. The indicator will light red during start up or if there is a malfunction. The indicator will light yellow when the unit is ready to operate. If the power indicator light turns from yellow to red, turn off the power and refer to *Protection circuit*. If the trouble is still not resolved, ask your dealer.

#### 2. Power switch

Press to turn the power on/off. Flip the switch to the right to turn the power on; flip the switch to the left to turn the power off.

#### Rear panel

#### 3. INPUT terminal (BALANCED)

Connect to Pre-Amplifier.

#### 4. AC IN connector

Connect the accessory power cord here.

#### 5. SPEAKERS terminals

Connect speakers with impedance of  $4 \Omega$  to  $16 \Omega$ .

### 3. BASIC ITEMS FOR SERVICE

#### 3.1 CHECK POINTS AFTER SERVICING

**A Items to be checked after servicing**

To keep the product quality after servicing, confirm recommended check points shown below.

No.	Procedures	Check points
1	Confirm whether the customer complain has been solved.	The customer complain must not be reappeared. Audio and operations must be normal.
2	Check the analog audio playback. (Make the analog connections with a CD player.)	Each channel audio and operations must be normal.
3	Check the appearance of the product.	No scratches or dirt on its appearance after receiving it for service.

B

See the table below for the items to be checked regarding audio.

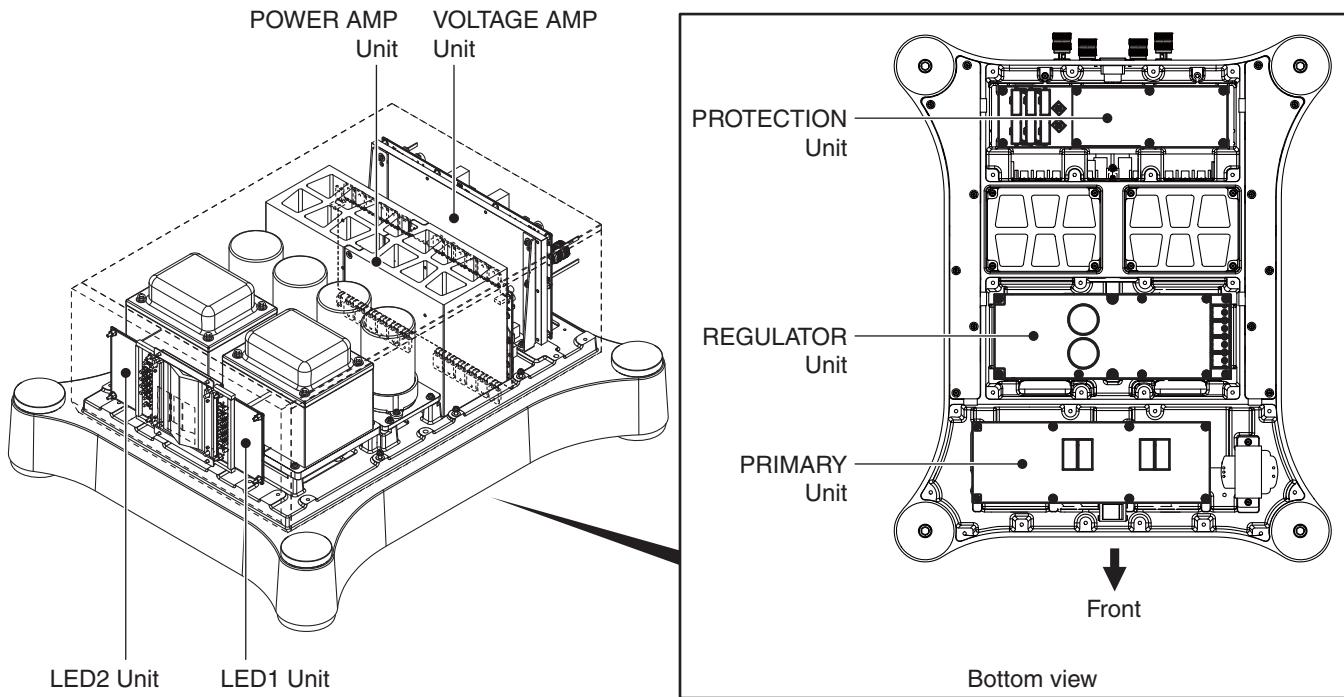

Item to be checked regarding audio
Distortion
Noise
Volume too low
Volume too high
Volume fluctuating
Sound interrupted

D

E

A

### VOLTAGE AMP UNIT

B

C

D

E

This circuit is a voltage amplifier stage of 30-dB gain. The input block (Q101, Q102, Q103, and Q104) is a buffer amplifier. A current mirror circuit has been adopted as a constant current circuit. Operating it on constant current reduces any influence of temperature drift. A diamond buffer circuit is constructed by cross-connecting this circuit and the initial stage of the amplifier section.

The signal voltage attribute that is input to the initial stage (Q107, Q108, Q109, and Q110) of the amplifier section is converted to current via the current mirror circuit (Q113 => Q115, Q114 => Q116). A Wilson Mirror circuit has been adopted as a current mirror circuit, for higher accuracy.

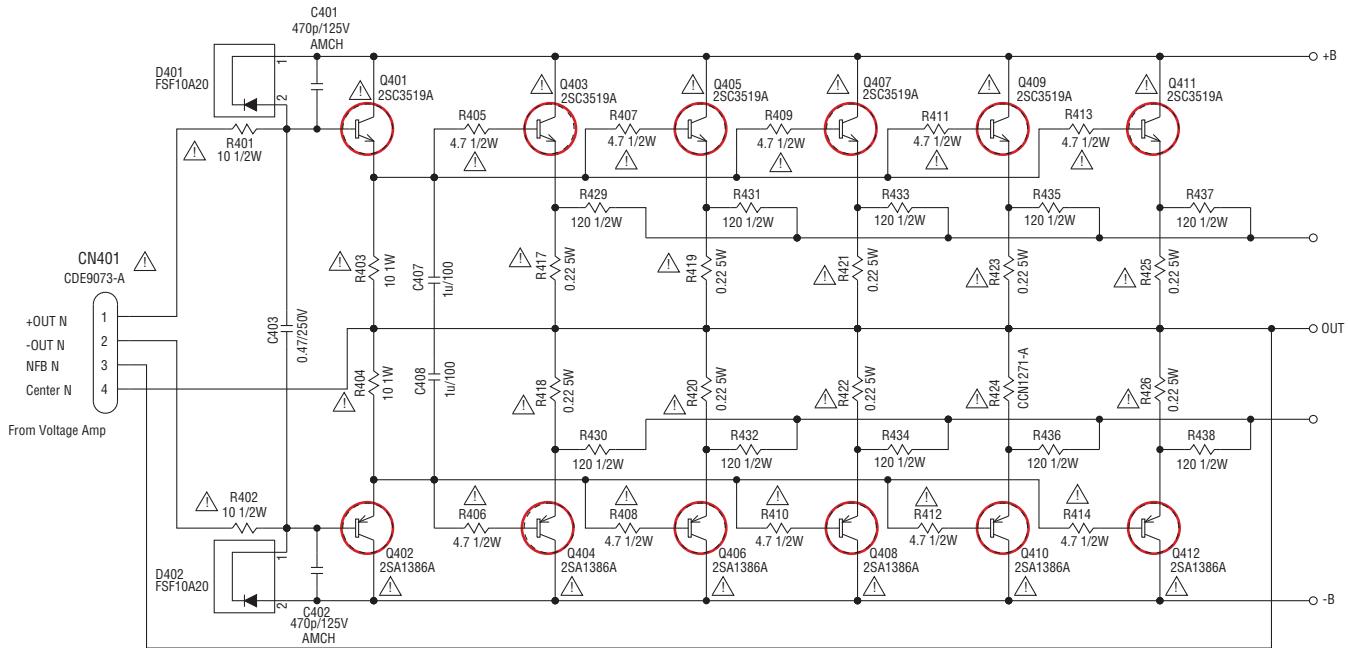

The V/I converted current attribute is converted to voltage with the aid of the input impedance of the SEPP circuit at the output buffer (Q121, Q122) then output.

To improve the high-frequency characteristics, a cascode bootstrap configuration (Q111, D101, Q112, and D102) at the initial stage improves the high-frequency characteristics.

The negative feedback (NFB) is applied from the output stage to the  $\beta$  circuit that consists of R145, R146, and R147. When the feedback is applied to the emitter that is located at the initial stage of the amplifier section, where the impedance is low, the NFB current flows and serves as the current feedback.

As described above, a high-accuracy circuit is adopted in each part, and a simple configuration is adopted in which the voltage attribute is converted to current then reconverted to voltage in one stage. Combined with a current feedback configuration, all these features achieve a highly stable amplifier.

## POWER AMP UNIT

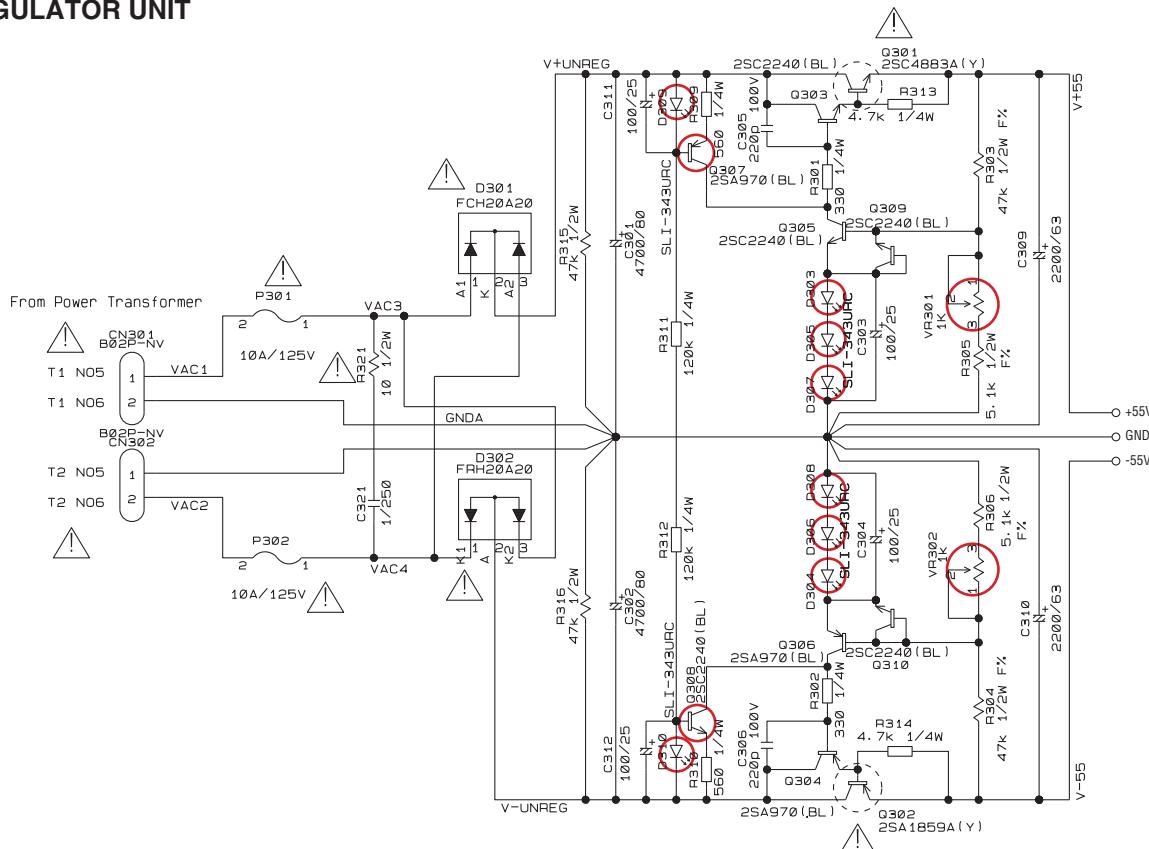

This circuit amplifies power. A three-stage Darlington structure is adopted, which includes the output SEPP at the voltage amplifier stage, driver stage (Q401, Q402), and final stage (Q403-Q412), which has 5-parallel push-pull composition.

All these allow driving of 600-W, 4-ohm output speakers without difficulty.

This circuit belongs to the AB class, with total idle current of 0.5 A (a product with power output up to 2 W belongs to the A class).

## REGULATOR UNIT

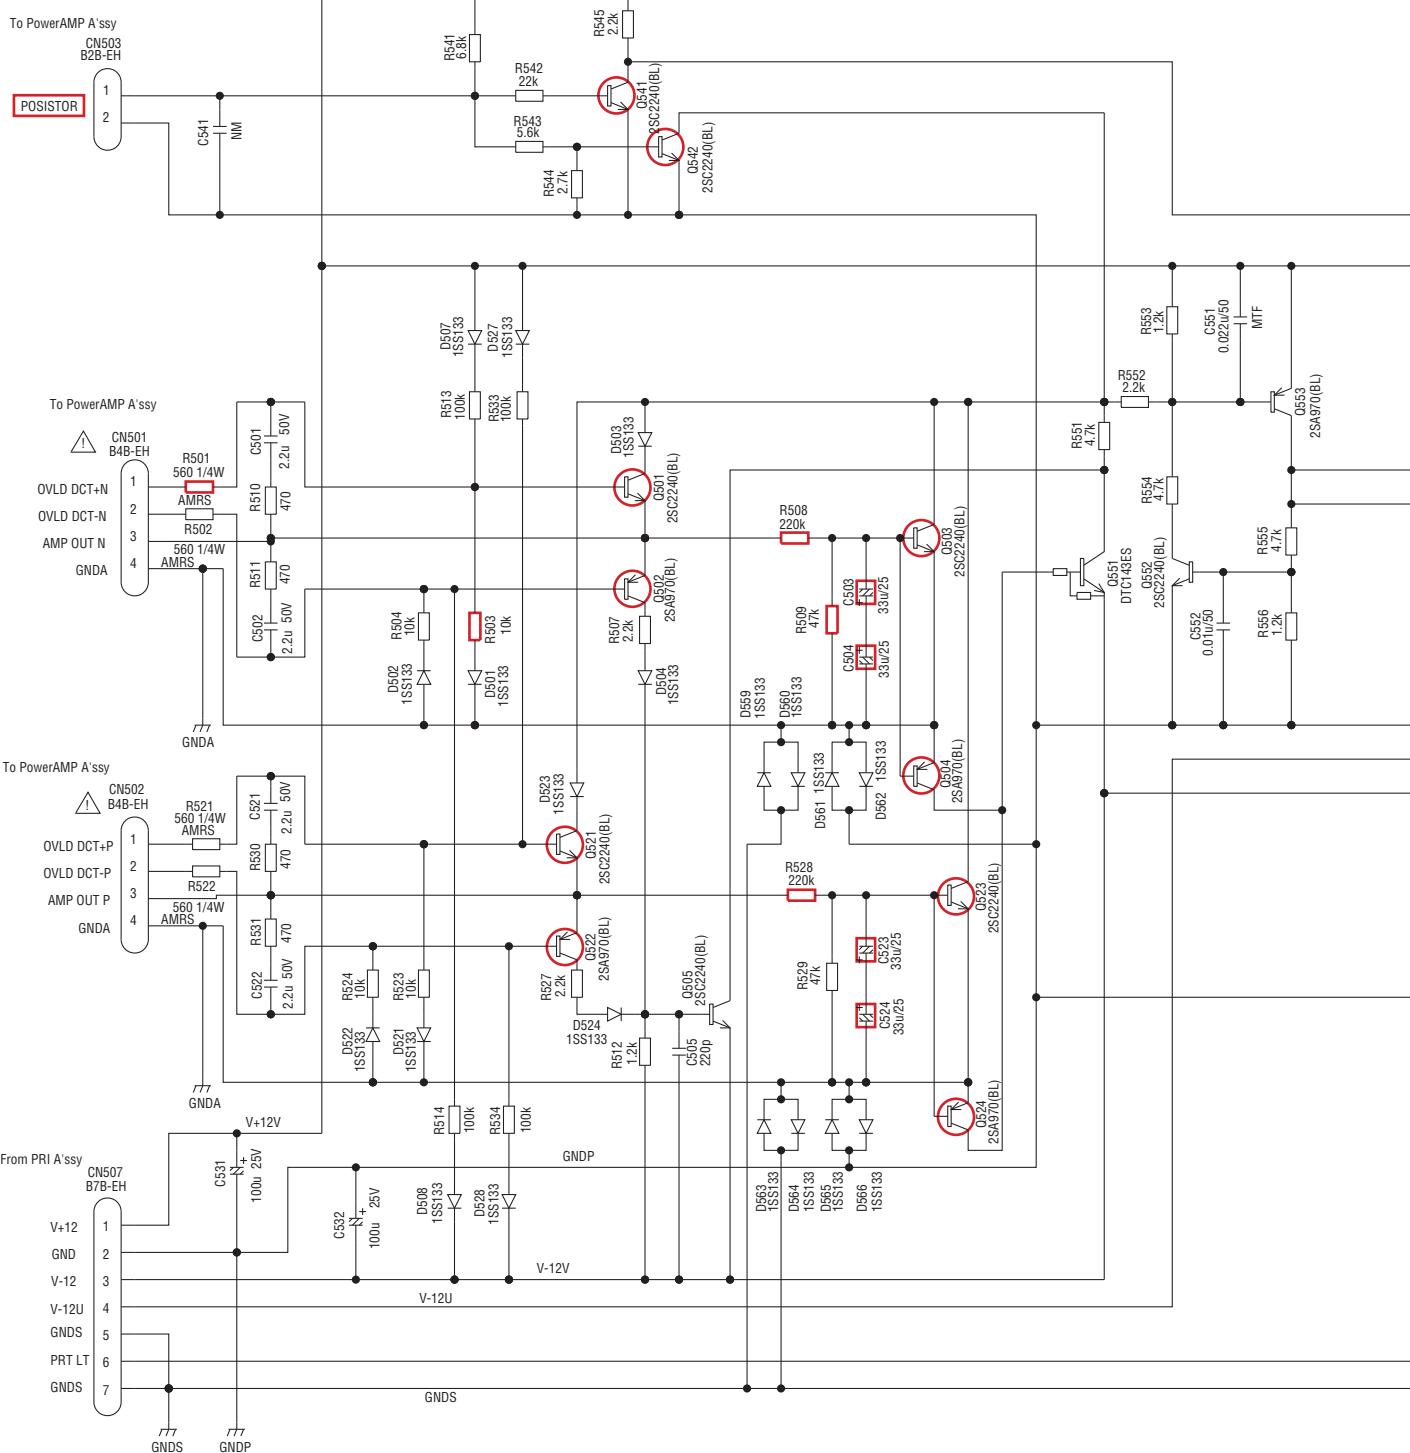

This is a basic feedback-type constant-voltage circuit.

The forward voltage ( $V_f$ ) of the LEDs (D303, D305, D307 [D304, D306, D308]) is used as the reference voltage, which is 5.4 V ( $1.8 \text{ V} \times 3$ ).

To suppress the influence of power fluctuations, a current mirror circuit (constant current circuit) that constitutes of Q307-D309 (Q308-D310) is used. Adjust the output voltage (VR301, VR302) to ±55 V.

A

## PROTECTION UNIT

### Overcurrent detection

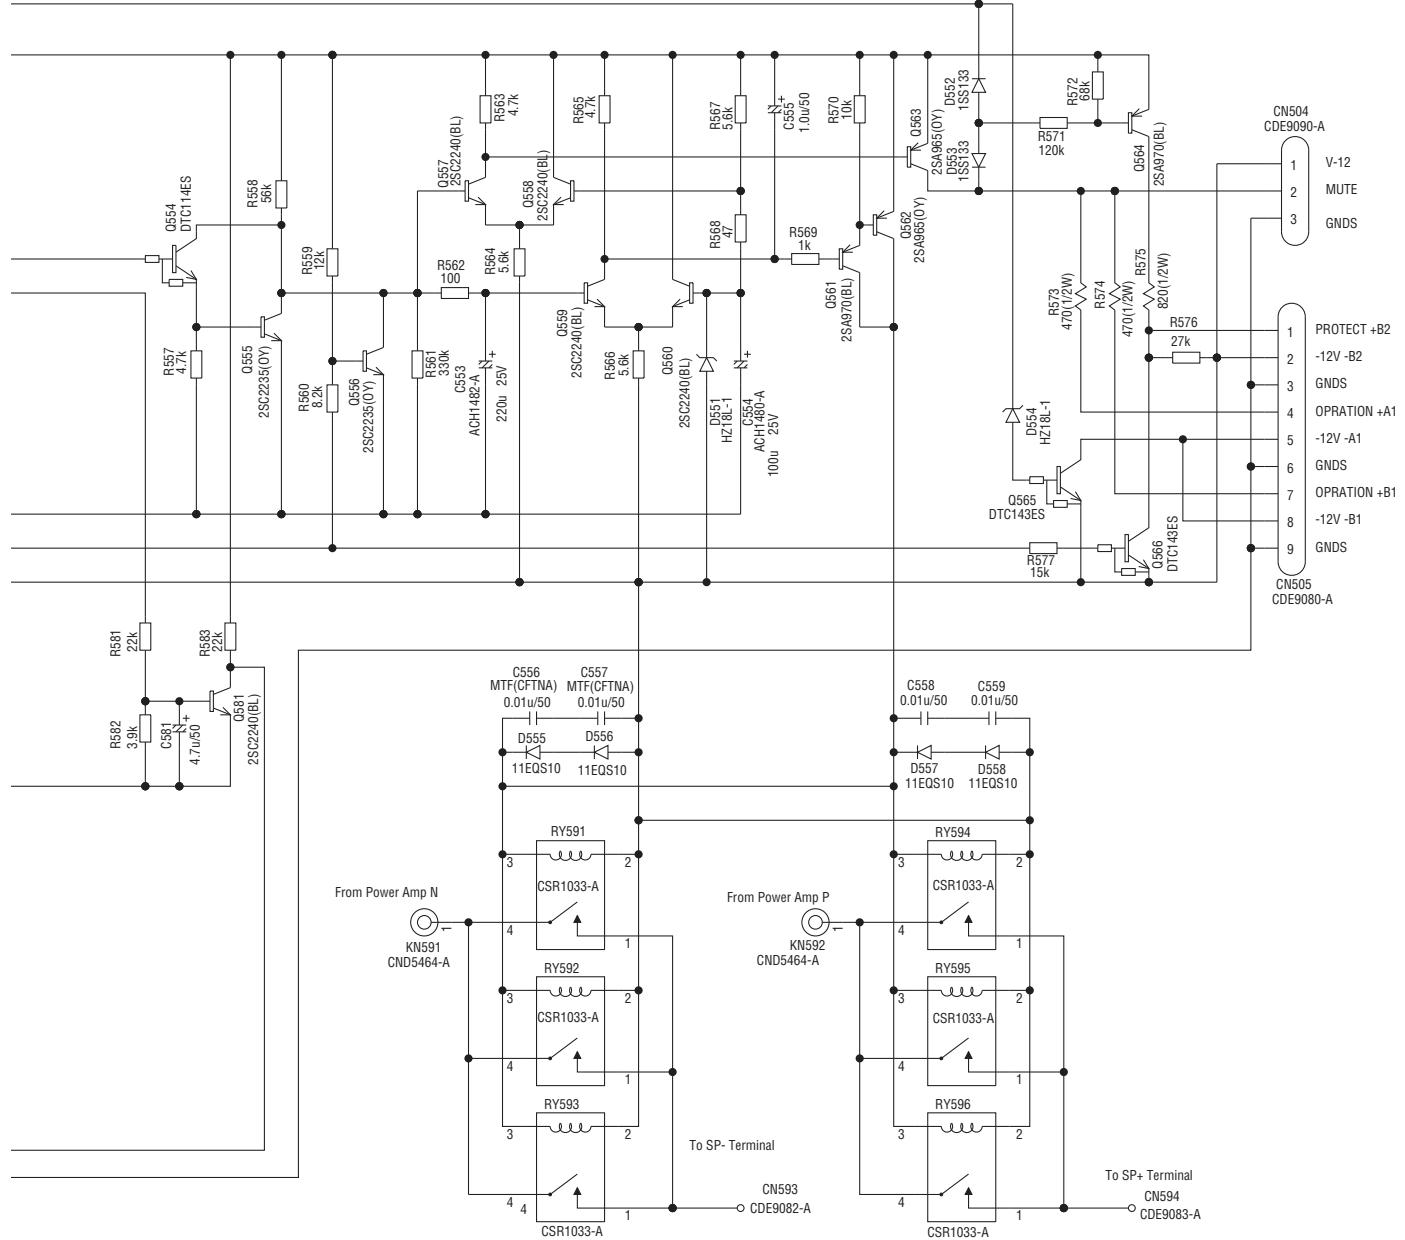

Each of Q501, Q502, Q521, and Q522 is an overcurrent detection transistor. For example, in the case of Q501, bridge detection by R501, R503, emitter resistor ( $0.22\text{ ohm} \div 5$  [parallel push-pull circuits] =  $0.044\text{ ohm}$ ), and load is performed.

If the bridge becomes out of balance, the transistor is turned on and the protection function is activated (speaker relay: OFF, main power: OFF).

### DC detection

DC detection transistors are Q503-Q504 and Q523-Q524. The low-pass filter (R508-C503 and C504 [R528-C523 and C524]) cuts the AC component.

If current higher than that determined by a ratio of resistance values of R508 and R509 flows and the DC component reaches about 3 V, the transistor is turned on and the protection function is activated (speaker relay: OFF, main power: OFF).

### Temperature detection

If the temperature rises, the resistance value of the positive thermistor (TH490) mounted on the heat sink also rises.

When the temperature reaches about 95 °C, Q541 is set to ON and the illumination on the front panel turns red.

**NOTE:** Under such circumstances, the protection function is not activated.)

If the temperature continues to rise and exceeds about 100 °C, Q542 is set to ON and the protection function is activated (speaker relay: OFF, main power: OFF).

For more details on the protection functions, see the descriptions below.

## A Detailed Descriptions on the Protection Functions

### Power-ON muting function

- When power is set to ON, signal muting is activated for about 8 seconds, resulting in no sound. While muting is activated, the red LEDs are lit.
- After signal muting is released, the red LEDs go dark, the white LEDs light, and sound is output.

### Power-ON surge killer function

- The surge killer circuit is activated for about 2 seconds after the power is set to ON to minimize the inrush current of AC power.
- When the surge killer function is released, sound of a relay operation may be output.

### B Overload-detection function

- The overload-detection circuit is instantly (within about 20 msec) activated when the impedance of the speaker that is connected to the load drops to less than 2 ohms, and if the output terminals are short-circuited or the output value becomes larger than the preset value.
- While this function is activated, the white LEDs go dark and the red LEDs light.
- To release this function, turn the unit off and check and correct overload status of the speaker or short-circuiting of the output terminals. Then turn the unit back on again.

### C Output DC detection function

- If DC voltage of 3 V or higher is generated at the output for some reason (when DC is input while DC is output from the preamplifier, failure in an internal part of the amplifier itself, etc.), the output DC detection circuit is activated.
- While this function is activated, the white LEDs go dark and the red LEDs light.
- To release this function, if DC output from the preamplifier is the cause, turn the unit off, connect the AC power, then turn the unit back on again.
- If failure in an internal part of the amplifier is suspected, repair it.

### D Temperature-detection function

- If there are continuous outputs larger than the upper limit expected from low-load output, or when the ambient temperature is high, the temperature of the heat sink is detected and the protection function will be activated.
- The temperature-detection function is activated in two steps, as described below.
- In the first step, if the temperature exceeds a preset temperature (90-95 °C), the white LEDs go dark and the red LEDs light to warn that the internal temperature of the amplifier is abnormally high, but sound continues to be output.
- In the second step, if the temperature exceeds another preset temperature (a preset temperature of the first step plus about 100 °C), the output is shut off and sound will not be output.
- If the first detection step is activated, lower the output level and the ambient temperature. If the red LEDs go dark and the white LEDs light, the amplifier can be used normally afterwards.
- If the second detection step is activated, turn the unit off. Let it cool down for several dozen minutes and lower the ambient temperature and the amplifier output level before turning it back on again.

### E Power-OFF muting function

- In order to prevent noise from being output when the unit is turned off, output will be instantly (within about 20 msec) shut off and muted.
- In such circumstances, the LEDs go dark when muting is activated.

F

## Detailed Descriptions on the Protection Operations

### Power-ON muting operation

- The voltages at R558 and C553 of the time-constant circuit are compared with the reference voltage at the difference amplifiers, and muting will be released when those voltages exceed the threshold levels.
- Two difference amplifiers are provided, with the slightly different threshold levels (approx. 50 mV = R568 voltage drop, 50 ms). The output relay is first set to ON then the input relay is set to ON.

### Power-ON surge killer operation

- When the voltages at R686 and C682 of the time constant circuit exceed approx. 7.2 V (-12 + D551 + 1.2), Q682 and Q683 are set to ON, the relay of the surge killer circuit is activated, and the surge killer resistor is short-circuited.
- When the unit is turned off, Q681 is set to ON, Q682 and Q683 are set to OFF, and the relay of the surge killer circuit is released.

### Overload-detection operation

- The overload status (approx. 0.5 ohm or less) on the + side is detected at Q501 and Q521, and that on the - side is detected at Q502 and Q522. Detection of an abnormality is retained via the latch circuit that consists of Q552 and Q553. Then Q554 together with Q555 is set to ON, C553 is rapidly discharged, the subsequent differential circuit and output/input relays at the relay drive circuit are activated, then signals are set to OFF.
- The white LEDs go dark when Q563 is set to OFF, and the red LEDs light when Q564 is set to ON.
- To prevent arc discharge when the output relay is set to OFF, approx. 4-ms time-constant circuits are provided with the C555 and R565 circuits so that the output relay is activated later than the input relay.

### Output DC detection operation

- Audio signals are eliminated at the LPF that consists of R508, R509, C503, C504, and R528, R529, C523 and C524, and + DC output level is detected at Q503 (Q523) and - DC output level is detected at Q504 (Q524). Detection of an abnormality is retained via the latch circuit that consists of Q552 and Q553. The same operations as those for overload detection will then follow.
- The detection levels are Approx.  $V_{be}^*(R509/(R508 + R509))$ .
- The formula for the equivalent cutoff frequency of the LPF is as follows: Frequency determined by  $(R508 (R528)/R509 (R529))$  and  $(C503 (C523)/2)$  multiplied by (output peak voltage/detection level), given that  $C503 (C523) = C504 (C524)$ .

### Temperature-detection operation

- For temperature detection, use a TH490=PTFM04BD471Q2N34B0 (100 °C) type Posistor from Murata Manufacturing that can be secured to the heat sink with screws. The characteristics of this thermistor are as follows: at 80 °C, typical 100 ohms or less; at 90 °C, 330 ohms or less (typ. 100 ohms); at 100 °C, 470 ohms or higher (typ. approx. 1.5 k-ohms).
- In the first detection step, when the resistance value at the Posistor becomes 400 ohms or higher at a preset temperature of 90-95 °C, Q541 is set to ON, Q565 is set to OFF, and the white LEDs go dark. Instead, Q564 is set to ON and the red LEDs light.
- In the second detection step, when the resistance value at the Posistor becomes 1.4 k-ohms or higher at a preset temperature of approx. 100 °C, Q542 is set to ON. Detection of the abnormality is retained via the latch circuit that consists of Q552 and Q553. The same operations as those for overload detection will then follow.
- If the first detection step is activated, lower the output level and the ambient temperature. Q541 will be turned OFF, the red LEDs will go dark, and the white LEDs will light.

### Power-OFF muting operation

- At the - voltage rectifier circuit with a small time constant that consists of D654, D655, C661, R652, D656, C662 and R653, negative voltage is discharged for approx. 15 ms when the unit is turned OFF, Q556 is turned ON, and C553 is discharged in the route of R562. Then the input relay (Q556) to which the differential amplifier is directly connected is first released. Then the output relay is released slightly after the input relay when the electric potential at R562 has decreased.
- The current to be fed to the red LEDs is absorbed at Q566 and the red LEDs go dark approximately at the same time as the input relay is turned off.

## 6. SERVICE MODE

There is no information to be shown in this chapter.

## 7. DISASSEMBLY

A

### Note:

Even if the unit shown in the photos and illustrations in this manual may differ from your product, the procedures described here are common.

- Be careful not to scratch or stain the cabinet during servicing, because it may cause a serious complaint.
- As the product weighs 90 kg, be fully careful when handling it. Four people are required when moving it.
- Be careful of the order of wire arrangement at a place where several wires are secured together with a screw (on the power main electrolytic capacitor, etc.), as this can affect the sound quality. Follow the detailed procedure described in this section.
- As the product has conical feet, be very careful not to scratch floor surfaces in the customer's home.

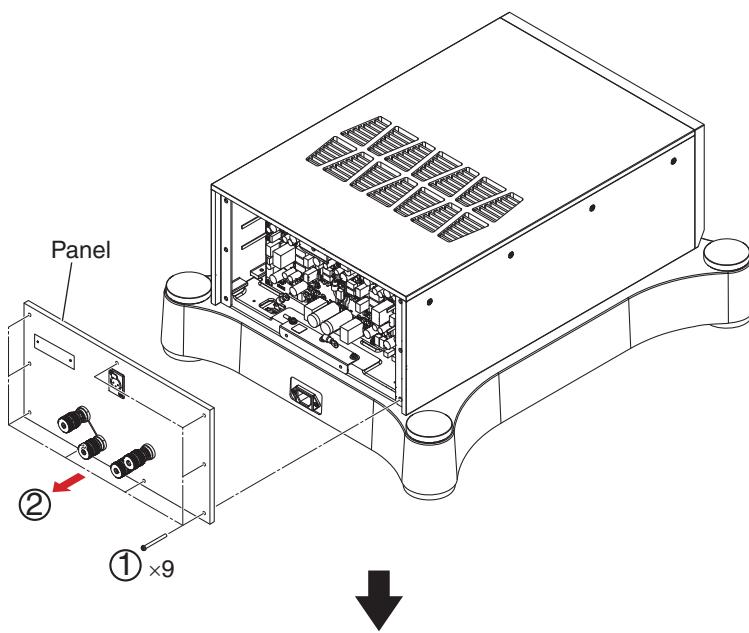

B

### Disassembly

#### [1] Exterior Section

##### [1-1] Panel (Rear)

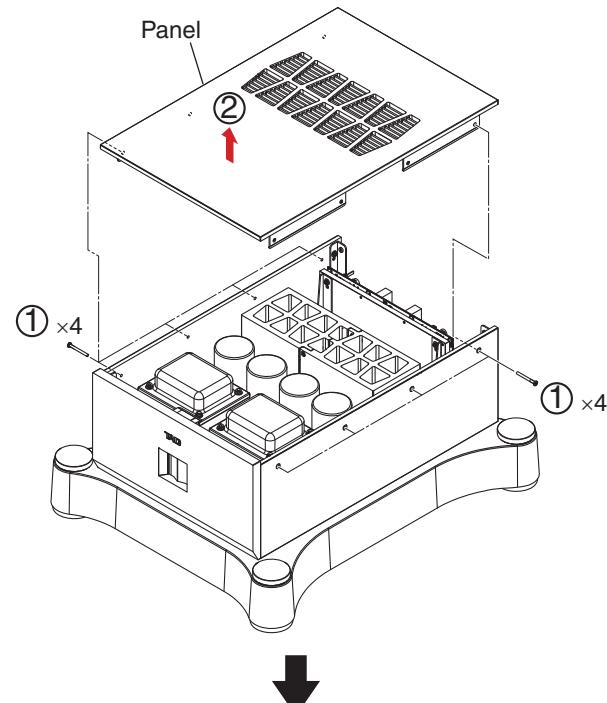

- (1) Remove the nine screws. (BMZ40P140FCC)
- (2) Remove the panel.
- (3) Release the jumper wires, as required.

C

##### [1-2] Panel (Top)

- (1) Remove the eight screws. (CBA2215)
- (2) Remove the panel.

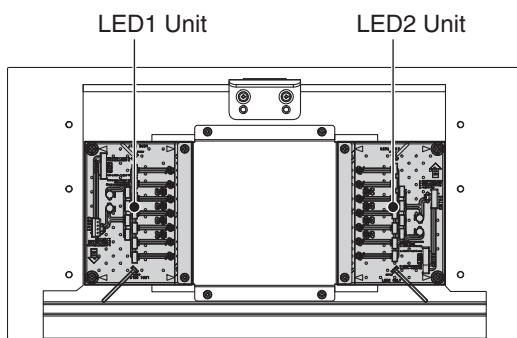

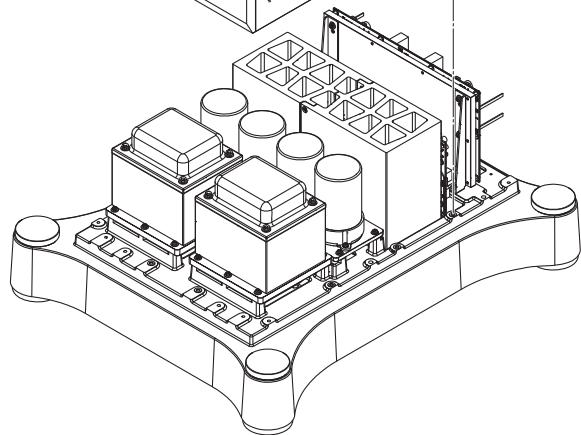

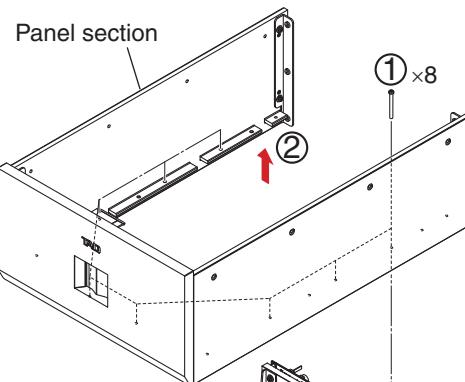

D

E

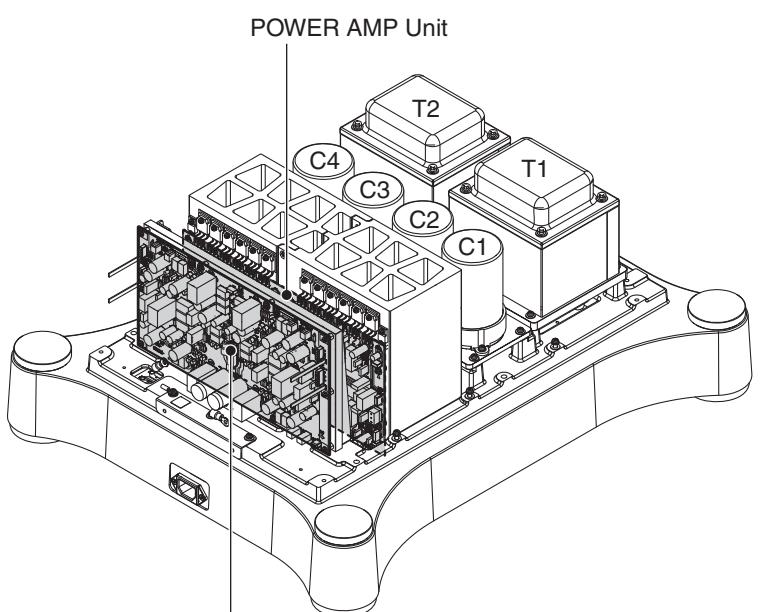

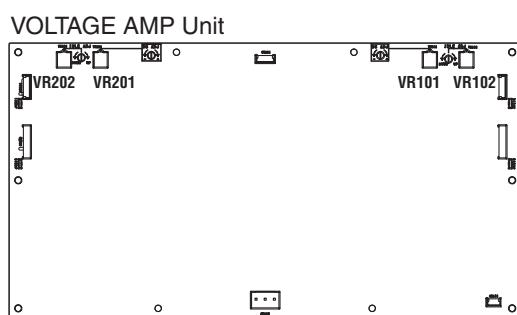

F

**[1-3] Panel section (Front and side)**

- (1) Remove the eight screws. (CBA2255)
- (2) Remove the panel section.
- (3) Release the jumper wires, as required.

• Rear view

• Rear view

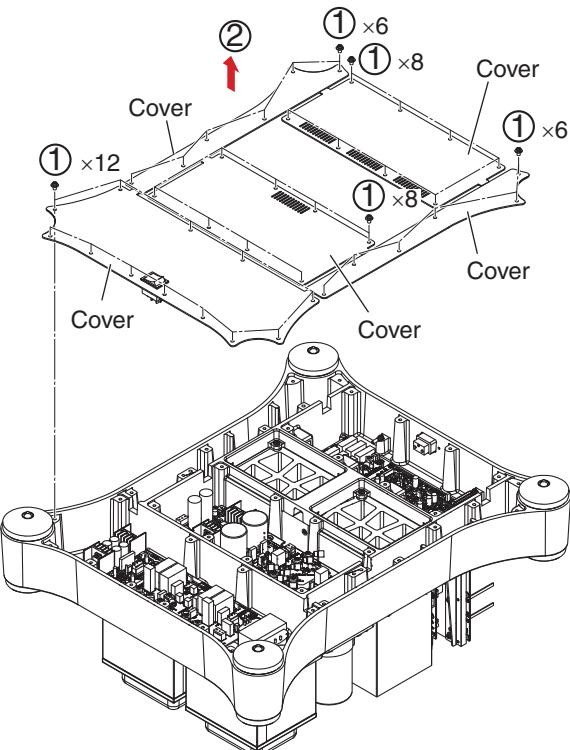

A

## [2] Bottom Section

### [2-1] Covers

- (1) Remove the 40 screws. (PMB40P080FCC)
- (2) Remove the all covers.
- (3) Release the jumper wires, as required.

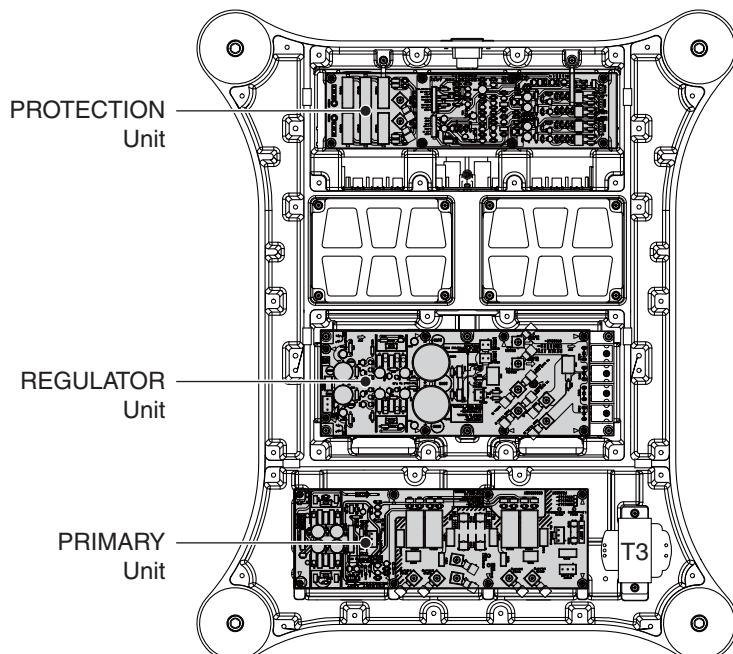

B

• Bottom view

D

• Bottom view

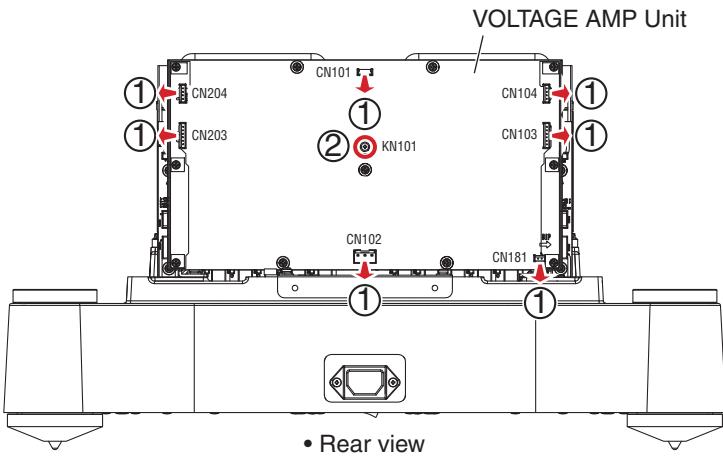

F

## Disassembly of PCB Assemblies

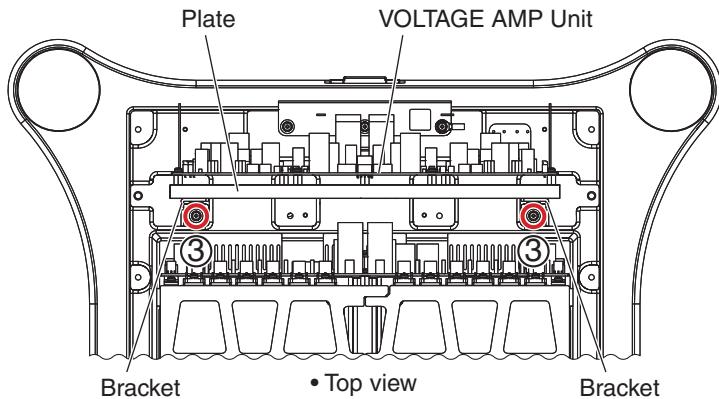

**Note:** In the following disassembly procedures, the PANEL Assy (including the rear panel) and all the bottom covers are assumed to have been removed.

### VOLTAGE AMP Unit

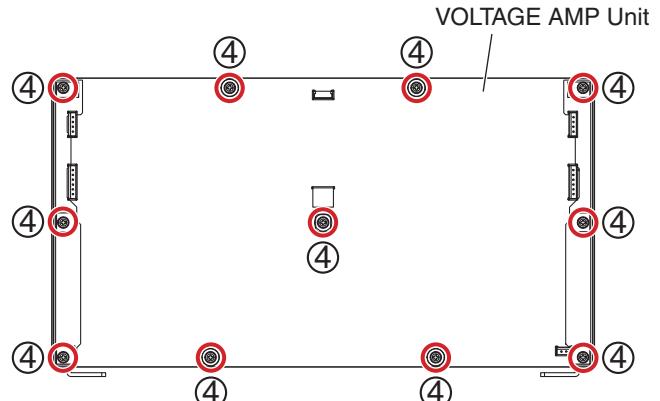

- (1) Remove the CN101 to CN104, CN203, CN204, and CN181.
- (2) Remove the screw for the KN101 then remove the cord (CDE9066).

- (3) Remove the two screws that secure the brackets (CND5327 and CND5328) to the chassis and remove the VOLTAGE AMP Unit together with the plate.

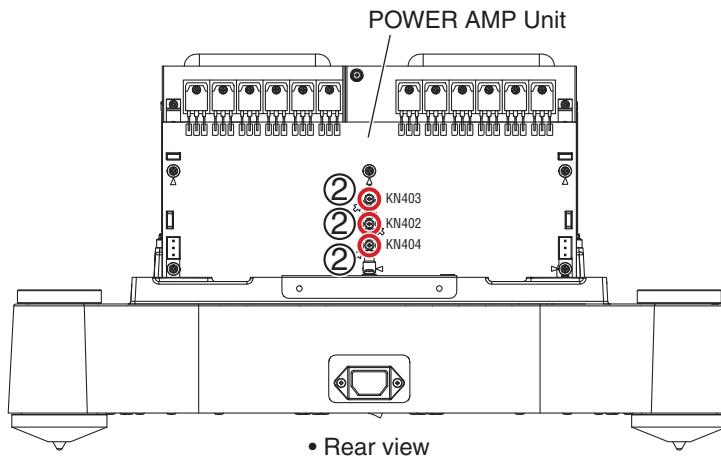

- (4) Remove the 11 screws then remove the VOLTAGE AMP Unit from the plate.

A

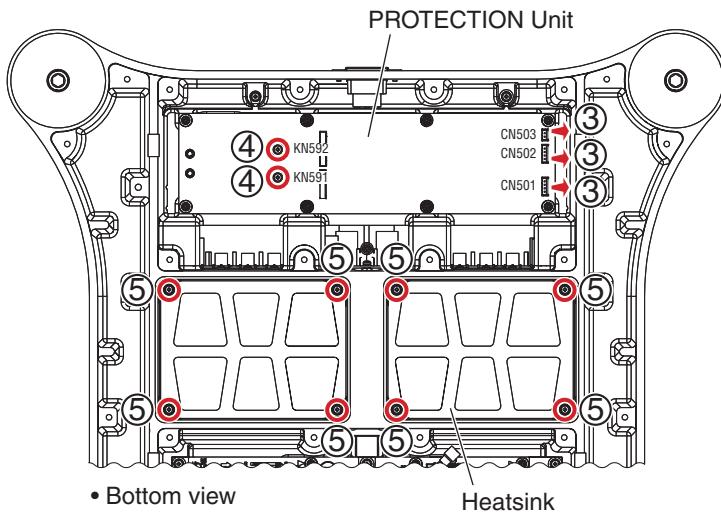

## ■ POWER AMP Unit

- (1) Remove the VOLTAGE AMP Unit together with the plate. (See "■ VOLTAGE AMP Unit".)
- (2) Remove the three screws for the KN402, KN403, and KN404 then remove the cords (CDE9062, CDE9063, and CDE9069).

B

- (3) Remove the CN501, CN502, and CN503 from the PROTECTION Unit.
- (4) Remove the two screws for the KN591 and KN592 from the PROTECTION unit then remove the cords (CDE9078 and CDE9079).
- (5) Remove the eight screws then remove the heatsink from chassis.

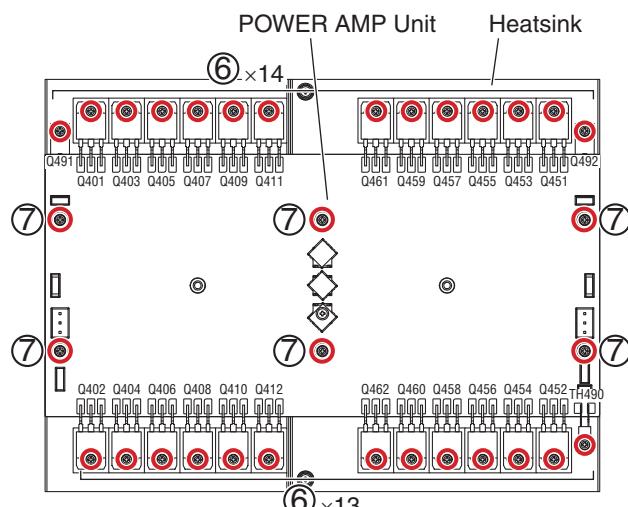

D

- (6) Remove the 27 screws from the all soldered power transistors (Q401 to Q412, Q451 to Q462, Q491 and Q492) and the posistor (TH490).
- (7) Remove the six screws then remove the POWER AMP Unit from the heatsink.

### Note on reassembly:

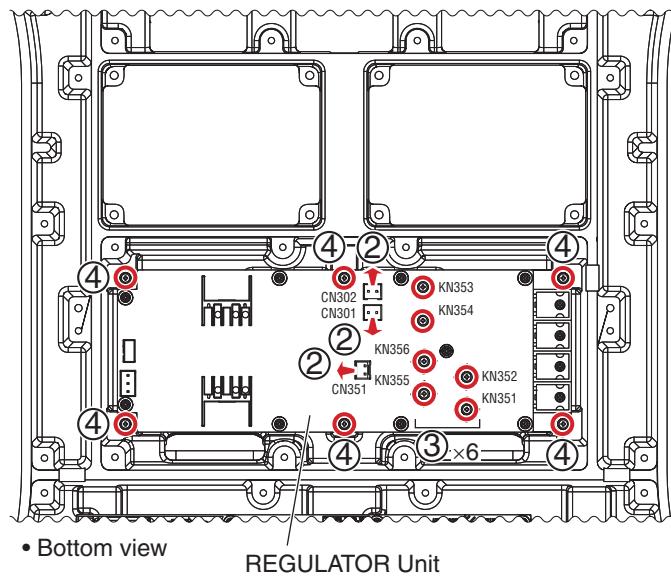

When reassembling, align the sheets (CNN3122) squarely beneath the transistors.

F

## ■ REGULATOR Unit

- (1) Remove the VOLTAGE AMP unit together with the plate. (See "■ VOLTAGE AMP Unit".)
- (2) Remove the CN301, CN302, and CN351.
- (3) Remove the six screws for the KN351 to KN356 then remove the cords connected.
- (4) Remove the six screws then remove the REGULATOR Unit together with the plate.

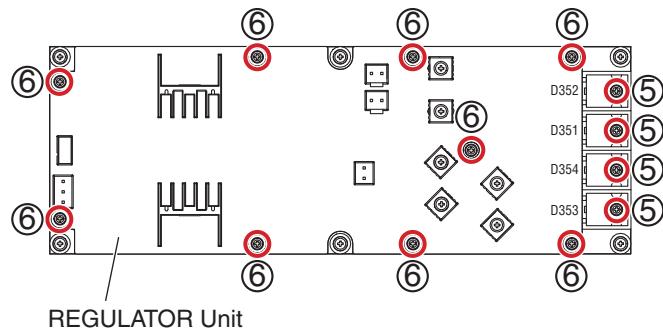

A

- (5) Remove the four screws that secure the rectifier diodes (D351 to D354) to the plate.
- (6) Remove the nine screws then remove the unit from the plate.

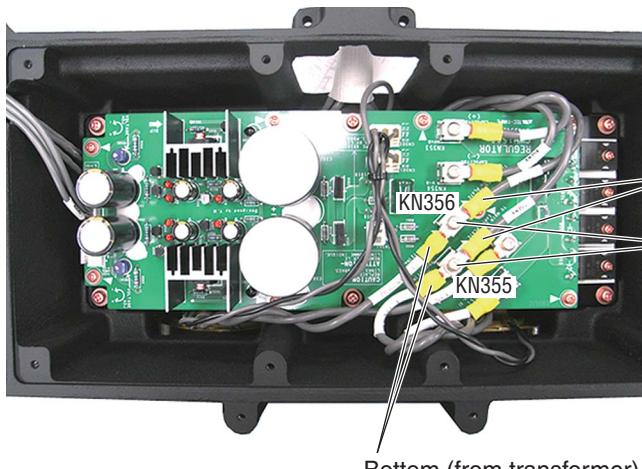

### Note on reassembly:

When reassembling, align the sheets (CNN3122) squarely beneath the diodes.

C

### Point to install several cables

D

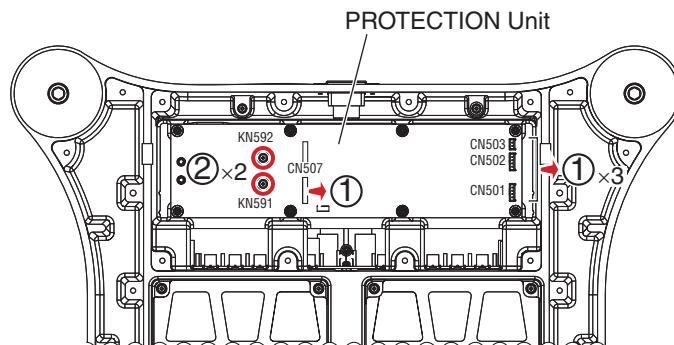

E

A

## ■ PROTECTION Unit

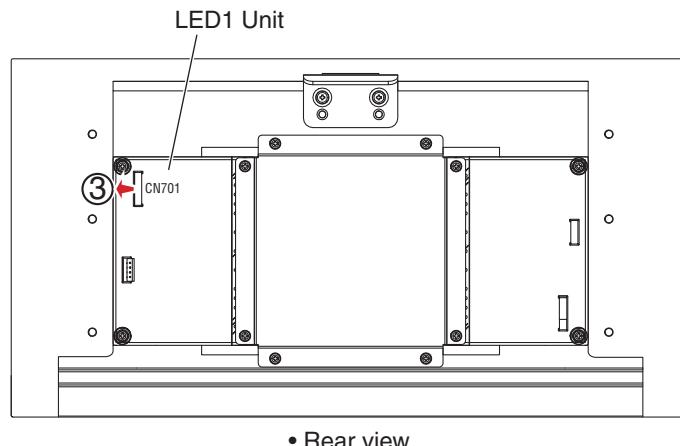

- (1) Remove the CN501, CN502, CN503, and CN507.
- (2) Remove the two screws for the KN591 and KN592 then remove the cords (CDE9078 and CDE9079).

B

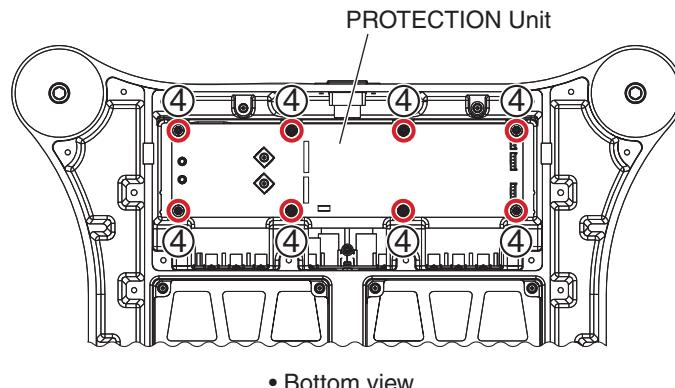

C

- (3) Remove the CN701 from the LED1 Unit.

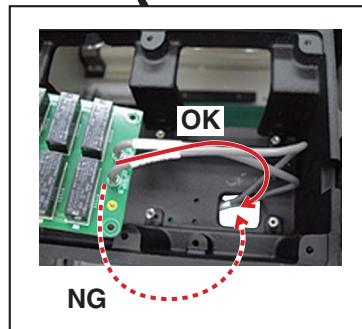

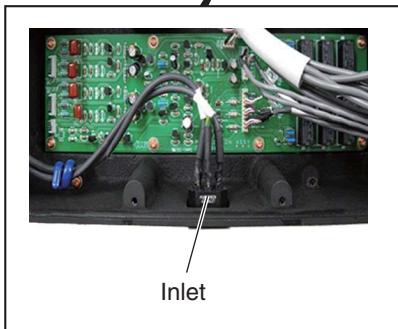

E

- (4) Remove the eight screws then remove the PROTECTION Unit.

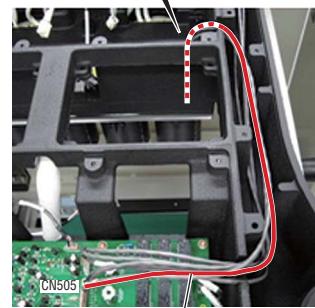

### Note of the wiring

- Before reassembling the PROTECTION Unit, the inlet must be attached.
- When mounting the PROTECTION Unit, incline it so that it will not come into contact with the cables from the inlet.

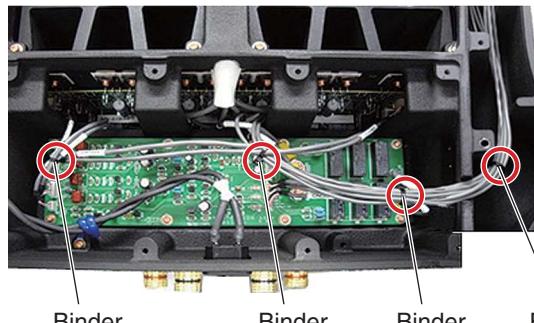

Let the cables droop toward the bottom of the chassis.

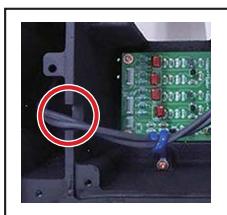

to LED1 Unit CN701

Pull out the cables in the direction of the arrow printed on the board.

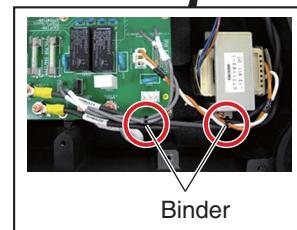

A

**Inlet wiring**

Cord clamer

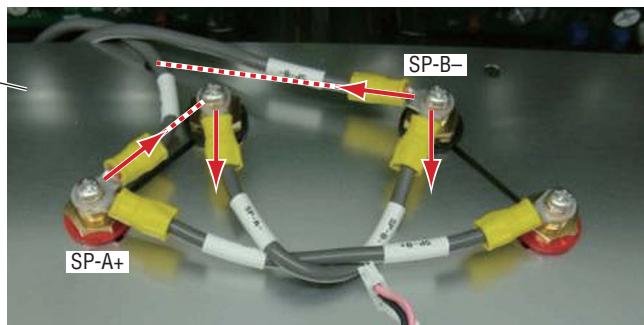

Secure the cables so that they will not move from side to side in the cord clamper.

Binder

**Speaker cables wiring**

Rear panel

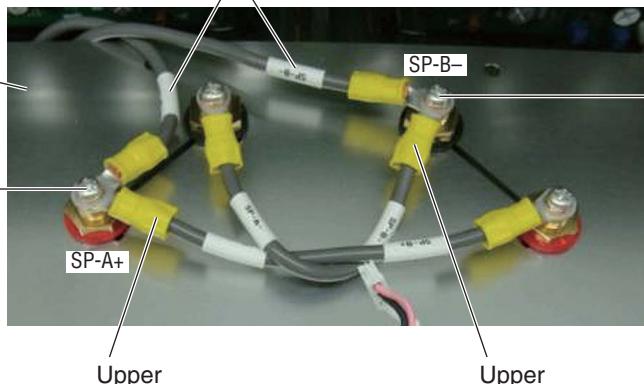

Pull out the cables in the directions indicated by the arrows.  
(This is to prevent the cables from coming into contact with the capacitor of the VOLTAGE AMP Unit.)

E

Bottom (from PROTECTION)

Rear panel

Tighten two cables together.

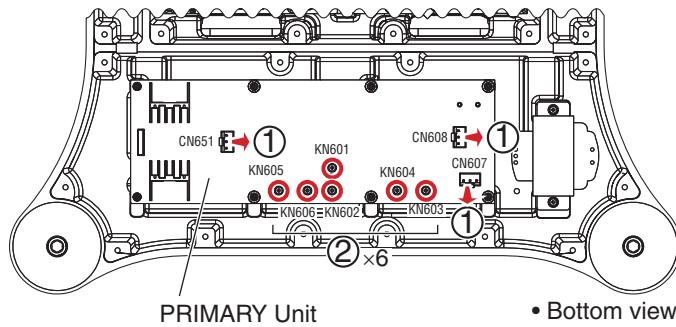

Tighten two cables together.

Upper

Upper

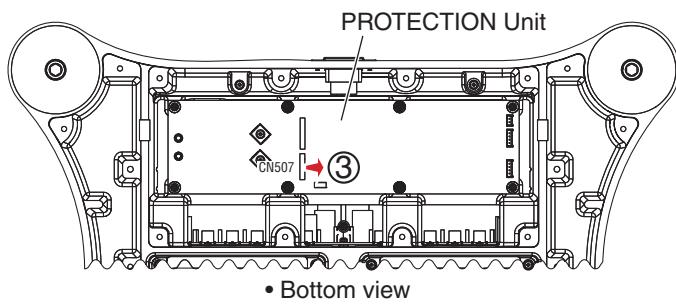

## ■ PRIMARY Unit

- (1) Remove the CN607, CN608, and CN651.
- (2) Remove the six screws for the KN601 to KN606 then remove the cords connected.

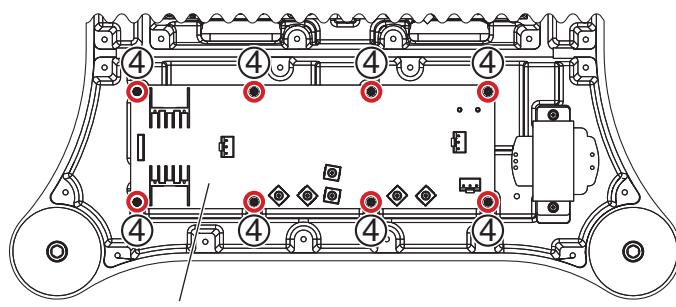

• Bottom view

- (3) Remove the CN507 from the PROTECTION Unit.

• Bottom view

- (4) Remove the eight screws then remove the PRIMARY Unit.

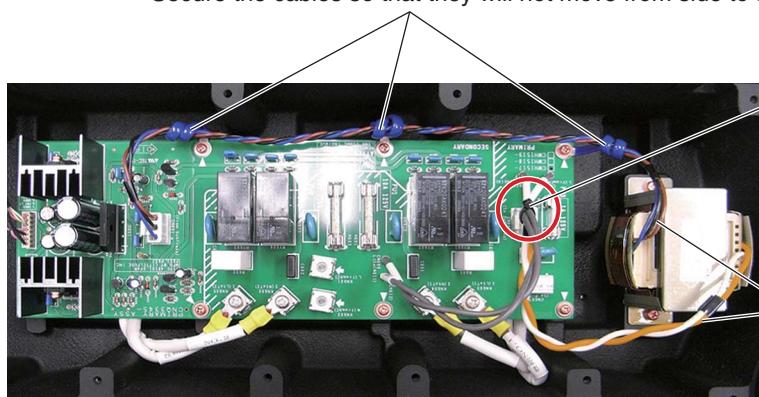

• Bottom view

### Note of the wiring

#### Cord clamer

- Align the cord clammers with the edge of the board.
- Do not place the cable under the board.
- Secure the cables so that they will not move from side to side in the cord clamper.

#### Binder

- Bundle the 3 cables from the CN611, CN612, and CN608.
- Secure the bundled cables at the base of the CN608.
- Place the bundled cables apart from the fuse.

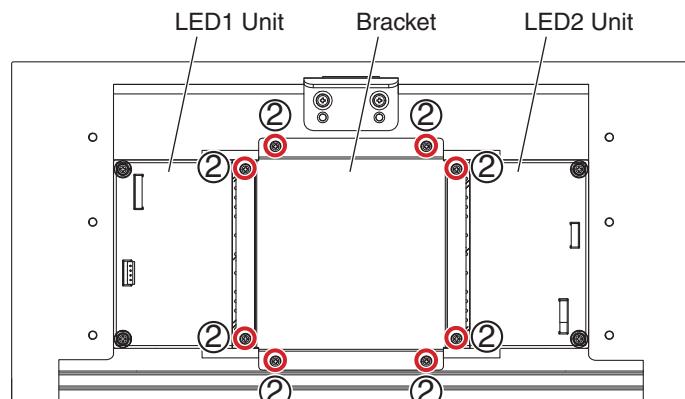

F  
Be careful of the orientation of the transformer and the colors of the wires.

**Primary side:** Orange and white cables

**Secondary side:** Brown and blue cables

## A ■ LED1 Unit and LDE2 Unit

- (1) Remove the front panel.
- (2) Remove the eight screws then remove the bracket (CND5312).

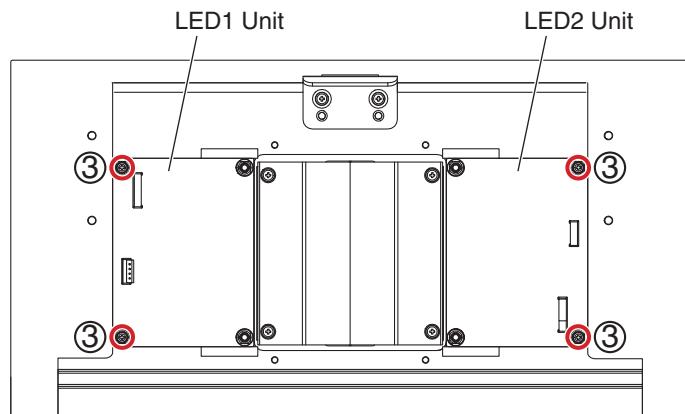

• Rear view

B

- (3) Remove the four screws then remove the LED1 and LED2 Units.

C

• Rear view

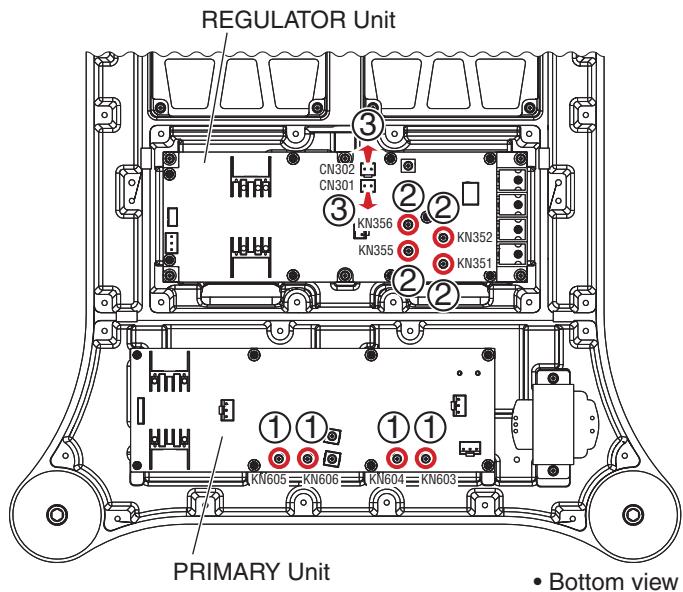

D

E

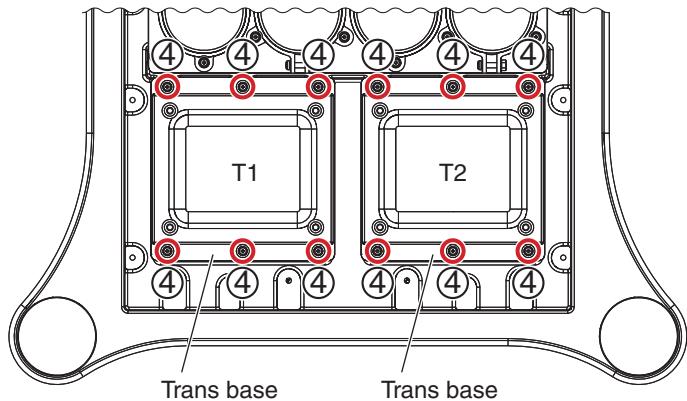

F

## ■ Transformers

- (1) Remove the four screws for the KN603, KN604, KN605 and KN606 from the PRIMARY Unit then remove the primary lead wires for the transformer.
- (2) Remove the four screws for the KN351, KN352, KN355, and KN356 from the REGULATOR Unit then remove the secondary lead wires for the transformer.
- (3) Remove the CN301 and CN302 from the REGULATOR Unit.

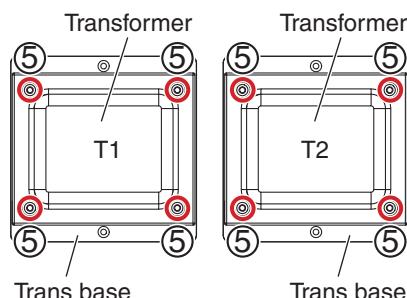

- (4) Remove the 12 screws then remove the trans base together with the transformers.

- (5) Remove the eight hexagonal screws then remove the transformer from the trans base.

**Note:**

Remove the PRIMARY and/or REGULATOR Units, as required.

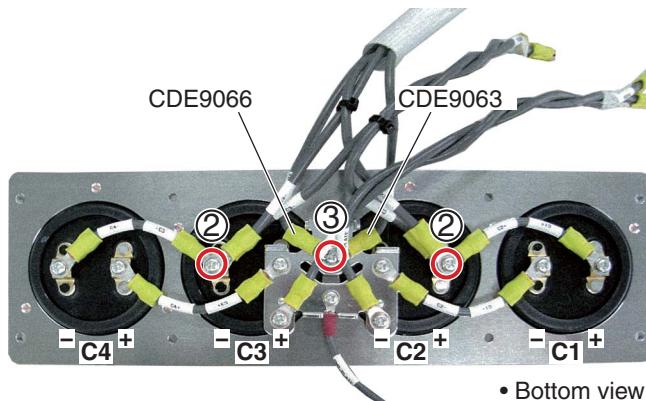

A

## ■ Capacitors

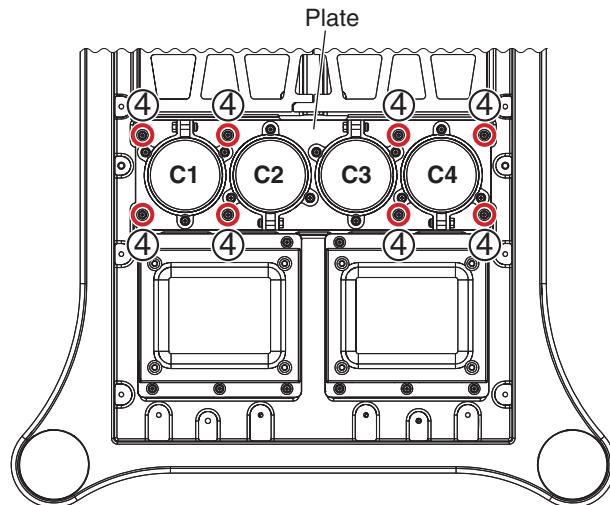

- (1) Remove the REGULATOR Unit together with the plate. (See "■ REGULATOR Unit".)
- (2) Remove the two screws from the positive electrode of C2 and the negative electrode of C3 then remove the lead wires.
- (3) Remove the screw then remove the cords (CDE9063 and CDE9066).

B

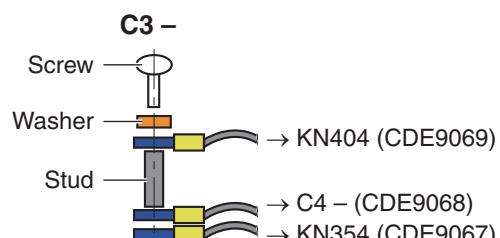

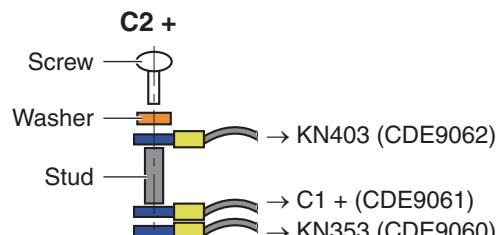

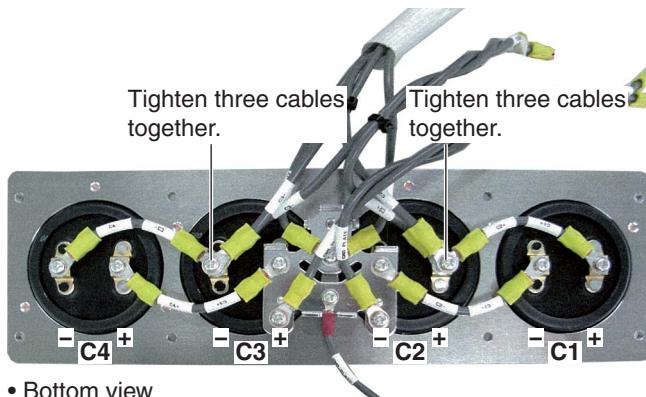

- C (4) Remove the eight screws then remove the plate together with the main electrolytic capacitor.

D

**Point to install several cables**

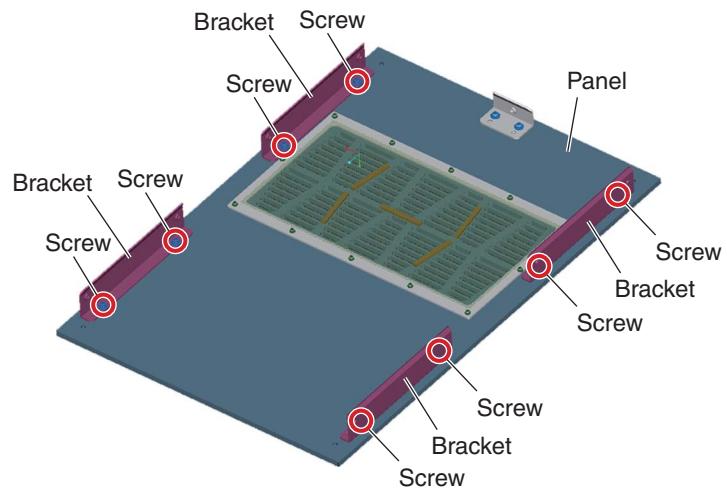

E

## Assembling of The Panel Section

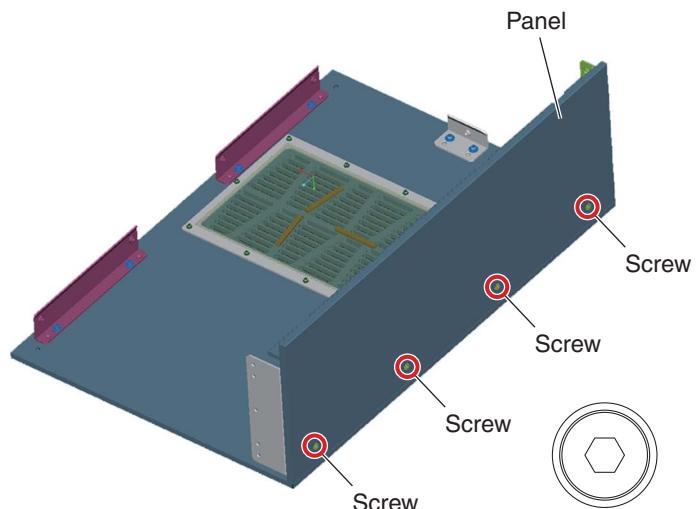

### [1] Top Section

Place the 4 brackets (CND5455) on the panel (CNS9980) and secure them using the 8 screws (PMB40P080FCC).  
(Tighten the screws loosely so that the brackets can move slightly.)

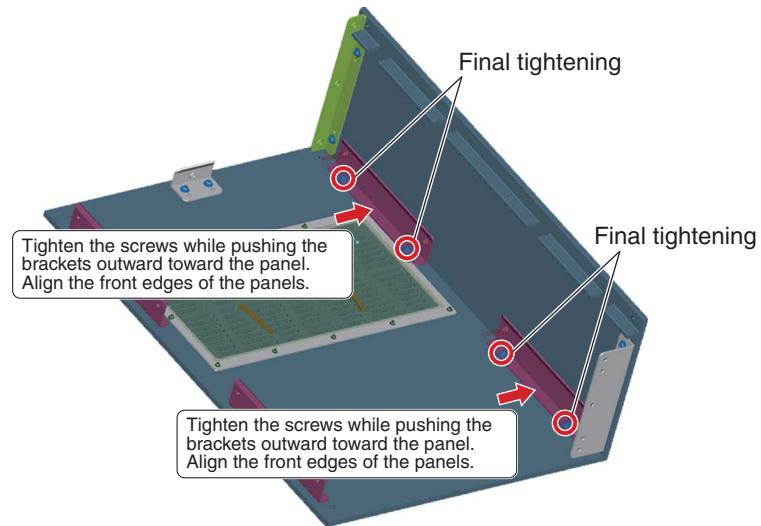

### [2] Side Section

Place the side panel (CNS9978) then lightly secure it (temporary tightening,) using the 4 screws (CBA2215). Be sure to place each screw near the center of the hole (counter boring).

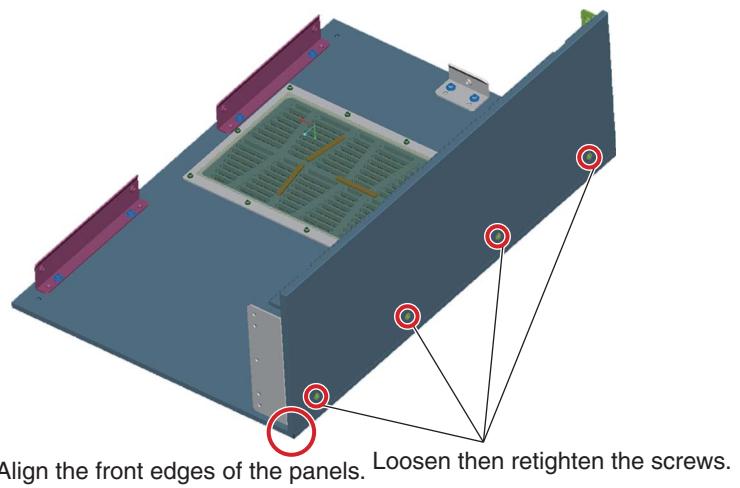

A

- After aligning the front edges of the panels, tighten the 4 screws (PMB40P080FCC) securely (final tightening) while pushing the brackets outward.

B

- c Loosen the 4 side screws (CBA2215) then retighten them while pushing one panel against another, paying attention that there will be no gap between the panels (final tightening). At this time also, align the front edges of the panels.

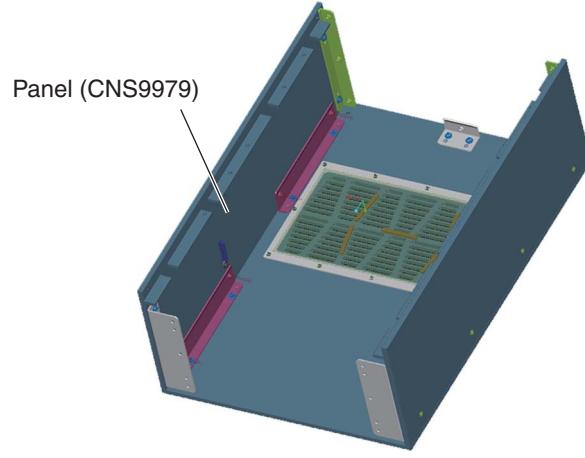

D

Align the front edges of the panels. Loosen then retighten the screws.

Mount the opposite side panel in the same way.

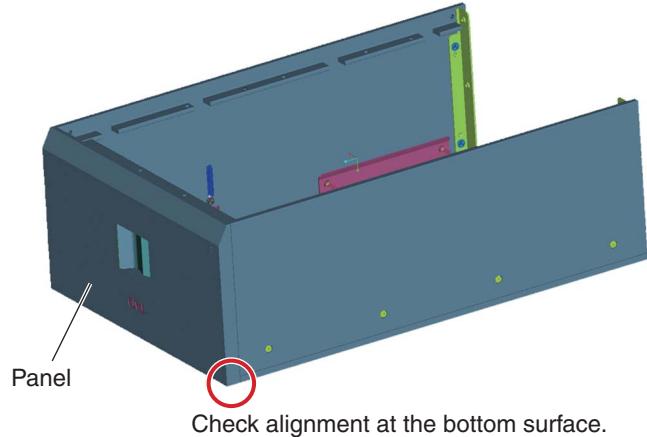

E

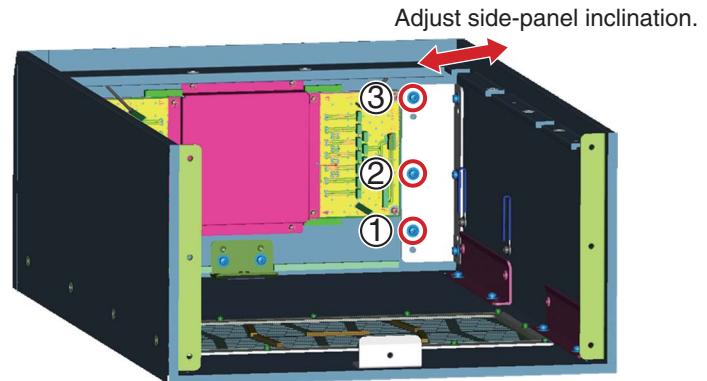

F

### [3] Front Section

Place the panel (CNS9976). Make sure that there is no unevenness or gap between panels in each surface.

Secure the screws (PMB40P080FCC) in order from the bottom, paying attention that there will be no unevenness or gap between panels in each surface, as in a previous procedure .  
As the side panels tend to incline, secure the screws while adjusting the panel positions by hand.  
Secure the screws of both side panels.

Before attaching this panel assy to the main unit (chassis,) the top panel must be detached.

#### Procedure

- ① Detach the top panel then mount the U-shaped panel assy on the main unit.
- ② Temporarily secure the rear panel.
- ③ Secure the panel assy to the main unit, using the screws.
- ④ Secure the top panel again.
- ⑤ Secure the rear panel (final tightening).

# 8. EACH SETTING AND ADJUSTMENT

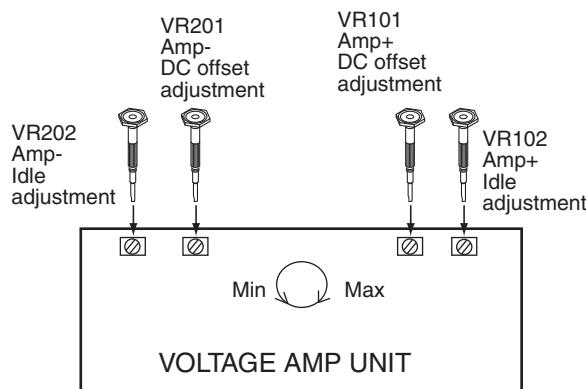

## 8.1 CD ADJUSTMENT

### A ■ DC OFFSET VOLTAGE AND IDLE CURRENT ADJUSTMENTS

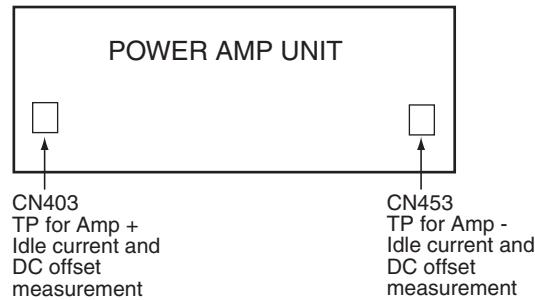

#### [Adjustments Procedure]

- (1) Fully turn the VR102 and VR202 semifixed resistors counterclockwise (for setting the idle current to minimum) before turning on the unit.
- (2) Turn on the unit with no load and no signal input.
- (3) Adjust the VR101 and VR102 semifixed resistors for DC offset adjustment so that the DC offset voltages for AMP+ and AMP- become  $0 \text{ mV} \pm 20 \text{ mV}$ .
- (4) Adjust the VR102 and VR202 semifixed resistors for idle current adjustment so that the voltages at the end of the emitter resistor for AMP+ and AMP- become  $11 \text{ mV} \pm 3 \text{ mV}$ .
- (5) Let the unit sit for 30 minutes under windless conditions.
- (6) Adjust the VR102 and VR202 semifixed resistors for idle current adjustment so that the voltages at the end of the emitter resistor for AMP+ and AMP- become  $15 \text{ mV} \pm 3 \text{ mV}$ .
- (7) Adjust the VR101 and VR102 semifixed resistors for DC offset adjustment so that the DC offset voltages for AMP+ and AMP- become  $0 \text{ mV} \pm 20 \text{ mV}$ .

#### [Adjustment Points]

#### [Measurement Points]

#### ● When measuring the idle current

#### (the voltages at the end of the emitter resistor)

CN403, CN453 (3P NV pin)

- 1: OVLD+
- 2: AMP OUT+/-
- 3: NC

Jigs for measurement: 3P NV connector

Measurement points: Measure the voltage between pin 1 and pin 2.

#### ● When measuring the DC offset voltage

CN403, CN453 (3P NV pin)

- 1: OVLD+
- 2: AMP OUT+/-
- 3: NC

Jigs for measurement: 3P NV connector

Measurement points: Measure the voltage between pin 2 and GND.

# 9. EXPLODED VIEWS AND PARTS LIST

- NOTES:
- Parts marked by “\*” are generally unavailable because they are not in our Master Spare Parts List.
  - The  mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
  - Screws adjacent to ▼ mark on product are used for disassembly.
  - For the applying amount of lubricants or glue, follow the instructions in this manual.  
(In the case of no amount instructions, apply as you think it appropriate.)

## 12. PCB PARTS LIST

- NOTES:**
- Parts marked by “ \* ” are generally unavailable because they are not in our Master Spare Parts List.
  - The  $\triangle$  mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
  - When ordering resistors, first convert resistance values into code form as shown in the following examples.

Ex.1 When there are 2 effective digits (any digit apart from 0), such as 560 ohm and 47 k ohm (tolerance is shown by J = 5%, and K = 10%).

560 $\Omega$	$\rightarrow$	$56 \times 10^1$	$\rightarrow$	561	.....	RDI/4PU [5] [6] [1] J
47 k $\Omega$	$\rightarrow$	$47 \times 10^3$	$\rightarrow$	473	.....	RDI/4PU [4] [7] [3] J
0.5 $\Omega$	$\rightarrow$	R50	.....			RN2H [R] [5] [0] K
1 $\Omega$	$\rightarrow$	IRO	.....			RS1P [1] [R] [0] K

Ex.2 When there are 3 effective digits (such as in high precision metal film resistors).

5.62 k $\Omega$	$\rightarrow$	$562 \times 10^1$	$\rightarrow$	5621	.....	RNI/4PC [5] [6] [2] [1] F
-----------------	---------------	-------------------	---------------	------	-------	---------------------------

- Meaning of the figures and others in the parentheses in the parts list.

Example) IC 301 is on the point (face A, 91 of x-axis, and 111 of y-axis) of the corresponding PC board.  
IC 301 (A, 91, 111) IC NJM2068V
