(8) BRIEF DESCRIPTION OF PROTECTOR CIRCUITS

1. Inrush Current Protective Circuit

When you switch Power "ON", the indicator LED will light up red. At first, AC voltage is provided to Power Transformer through R1306, and after 0.2 second, TR1301 will be turned on, and thus AC voltage is provided through Relay A.

This is to protect the Power Transformer T1401 from inrush current. This circuit is made up of Time Constant circuit R1302 and C1302. (Figure 34)

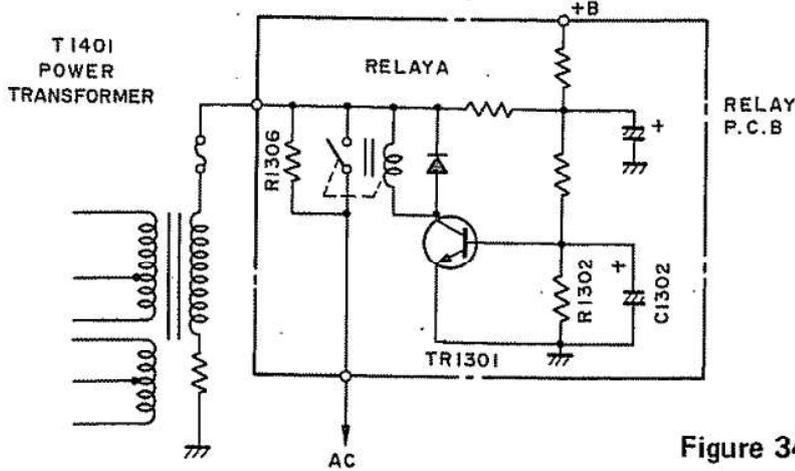

Figure 34

2. Speaker Protective Circuit

With Power Switch "ON", a five second signal delay is provided to the Speaker Output terminals by Relay B.

This is to protect Speakers from switching transients.

With Power Switch "ON", TR601, 602 and 603 will be turned on through Time Constant circuit R601 and C601. And indicator LED will change to green.

3. Main Amp Protective Circuit

If center voltage of Main Amp goes to ± 5 V (Natural Condition: within ± 15 mV) TR604, 605 and 606 will be turned on, and thus TR601, 602 and 603 will be turned off. If this should occur, Relay B will shut off output to the Speaker terminals and output will drop to zero and thus protect Main Amp and Speakers. In this case, indicator LED will turn to red. (Figure 35)

Note: To prevent AC voltages from upsetting these circuits, capacitors C602 and 603 have been incorporated. If AC voltage is applied to the base of TR604 and 605, it will be grounded through C602 and 603: thus TR604 and 605 are immune to AC voltages.

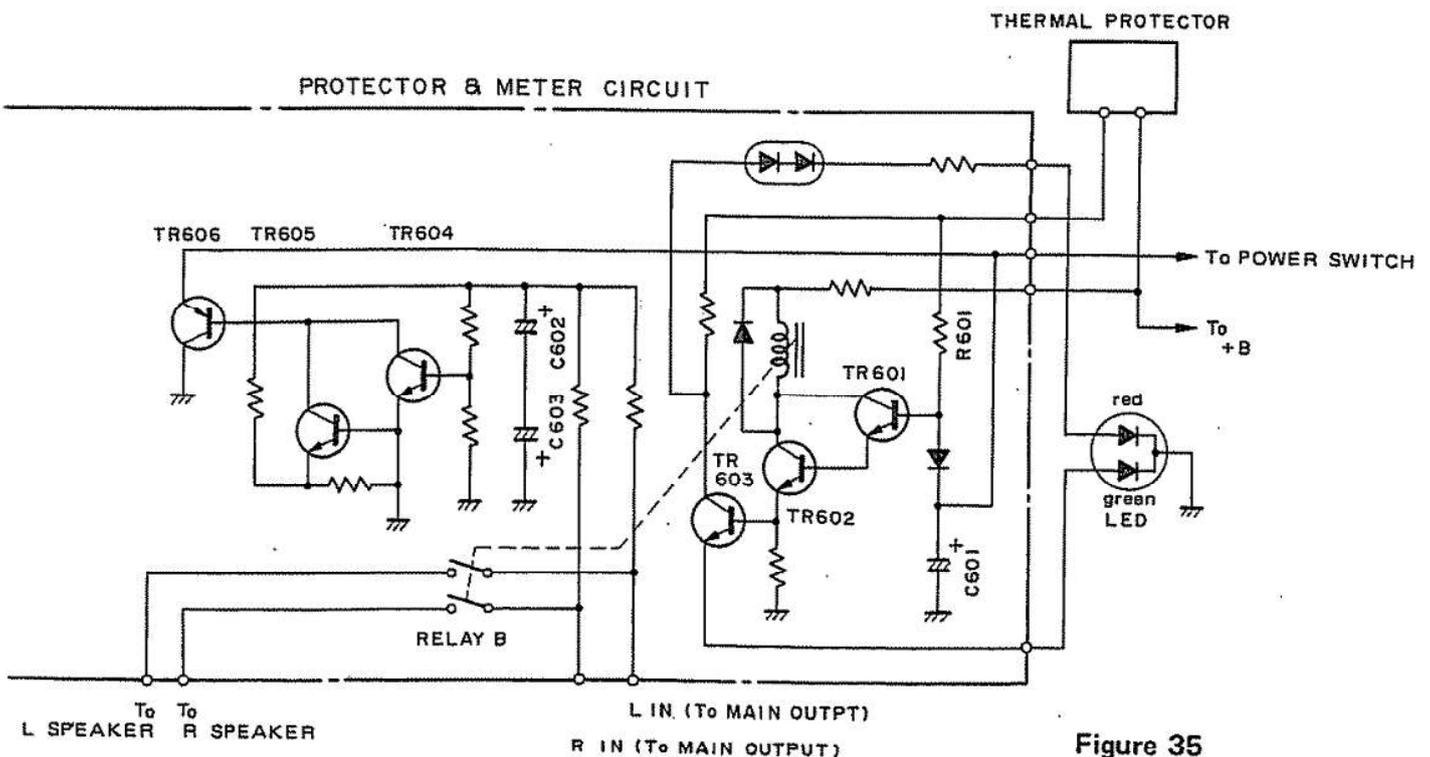

Figure 35

4. Main Amp Limiting Circuit

If Speaker terminals are shorted, the output line (© line of Figure 36A) is grounded and excessively high current flows from collector to emitter of TR509A (TR509B) and TR510A (TR510B), and a high voltage will appear across R529A (R529B) and R530A (R530B). This high voltage goes to base of TR513A (TR513B) and TR514A (TR514B).

When the voltage between base and emitter increases to about 0.6 V, TR513A (TR513B) and TR514A (TR514B) will be turned on.

High current (input signal of TR507A [TR507B] and TR508A [TR508B]) flows from collector to emitter of TR513A (TR513B) and TR514A (TR514B) through D505A (D505B) and D506A (D506B), and collector-to-emitter current of TR509A (TR509B) and TR510A (TR510B) will drop as Figure 36B (from © to ©', from © to ©') because of the output current limiting, and thus protect Power Transistors TR509A (TR509B), TR510A (TR510B) and TR511A (TR511B), TR512A (TR512B).

If this should occur, turn off the Receiver.

When the problem is corrected, turn the Receiver on again.

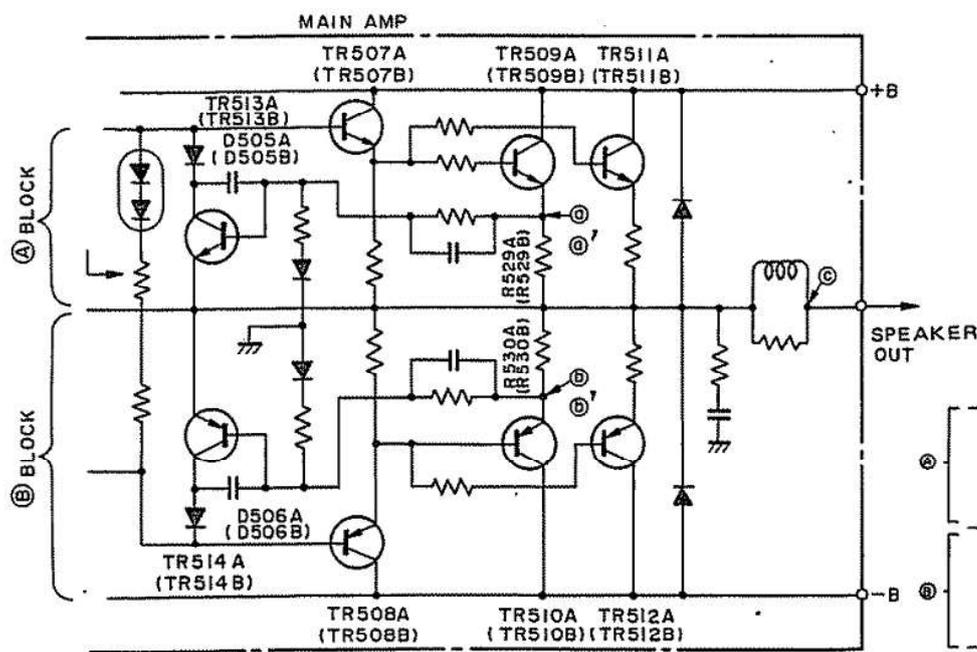

Figure 36A

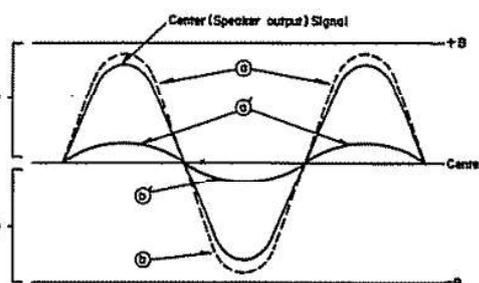

Figure 36B

5. Abnormal Temperature Rise Protection

If the temperature of Main Amp Heat Sink rises to 95°C, the thermal protector switch is shut off and TR601, 602 and 603 will be turned off, and Relay B will shut off.

In this case, Amplifier will automatically shut down and output will drop to zero. Indicator LED will turn to red.

If this should occur, turn the Receiver "OFF". When the temperature of the Main Amp Heat Sink falls to within the operating limits of the Receiver, the Thermal Protector switch will reset itself. When the problem is corrected, turn the Receiver on again. (Figure 35)

6. FM Noise and Switching/Muting Circuit

This circuit performs two functions.

- To eliminate the interstation hiss-noise sometimes noted just on either side of a station you are tuning in, with FM muting "ON".

With no signal received, the voltage applied to the base of TR1503 is 3V and both TR1503 and TR1504 are kept on, which activates the relay (REED Relay) and output is cut off. When a weak noise signal is received, the voltage drops to around 1.2V and both TR1503 and TR1504 remain on, keeping the relay activated and output cut off. When tuned to a station, the voltage drops further (to less than 1V) and TR1503/4 are turned off and the REED Relay is deactivated.

- b) To eliminate the clicking noise when function switch is turned from AM to FM (or FM to PHONO 1, PHONO 1 to PHONO 2, etc.).

The switch Ss-8 is a shorting type, goes through a short-circuit condition when turning from 1 (AM) to 2 (FM), etc. (it is momentarily grounded). This turns TR1501 off and TR1502 on. Thus, REED Relay is activated and output is cut off. The time constant of R1504 and C1502 allows the cut off condition to last for about one second (before C1502 charges up to a point where TR1501 turns on again, etc.). (Figure 37)

(11) THE VALUE SELECTED PARTS

The values of some parts are selected at the factory for optimum operation. If the circuitry does not operate properly, you can change these values.

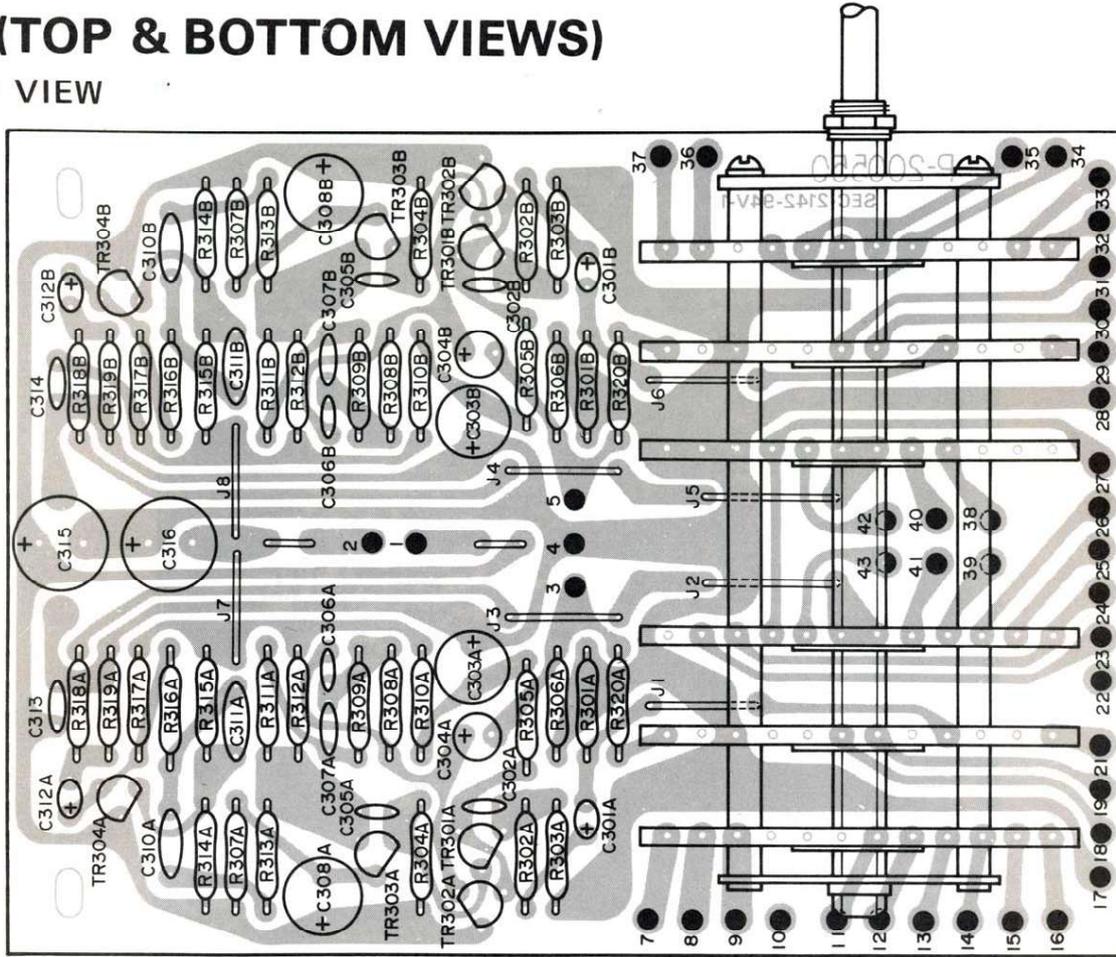

- R268 — This is to control AM IF output level. Use larger value to decrease AM IF output level.
- R232 — This is to control FM IF output level (R233-L ch, R232-R ch).
- R233 — Use larger value to decrease FM IF output level.
- R253 — This is to control FM Stereo Beacon sensitivity.
- R254 — For R253, use larger value to decrease Beacon sensitivity.
For R254, use larger value to increase Beacon sensitivity.
- R537A
- R537B — This is to control Limiting sensitivity for Main Amp.
- R538A — Use larger value to decrease Limiting sensitivity.
- R538B
