1. The supply voltage is 120 volts AC, 60 Hz (UL, C.S.A.), (220/240 volts AC, 50 Hz for European and 240 volts AC, 50 Hz for Australian models) from a regulated power supply.
  2. The power source must be insulated from other equipment, connected antenna or output.
  3. The room temperature is 25 degrees C.
  4. Nominal Specs represent the design specs; all units should be able to approximate these — some will exceed and some may drop slightly below these specs.  
Limit Specs represent the absolute worst condition which still might be considered acceptable: in no case should a unit perform to less than within any Limit Spec.

### (3) ABNORMAL TEMPERATURE RISE PROTECTION

If the temperature of Main Amp heat sink rises to 95°C, the thermal protector switch will shut off and secondary supply voltage of power transformer T901 will drop to zero.

If this should occur, turn the Receiver off. When the temperature of the Main Amp heat sink falls to within the operating limits of the Receiver, the thermal protector switch will reset itself. When the problem is corrected, the Receiver can be operated again.

### (4) SPEAKER PROTECTIVE CIRCUIT

With power switch "ON", a 4.5 second signal delay is provided to the speaker output terminal by Relay RY701 and RY702.

This is to protect speakers from switching transients.

With power switch "on", TR704 and TR705 will turn on through time constant circuit R710, 712 and C703. (See Figure 32)

### (5) FM Noise and Switching/Muting Circuit

This circuit performs two functions:

a) To eliminate the interstation hiss-noise sometimes noted between stations with FM muting "ON". With no signal received, the voltage applied to the base of TR309 is 3 V and both TR309 and TR310 are kept on. This activates the relay (Reed Relay RY301) and output is cut off.

When a weak noise signal is received, the voltage drops to around 1.2 V and both TR309 and TR310 remain on, keeping the relay RY301 activated and output cut off. When turned to a station, the voltage drops further (to less than 1 V) and TR309 and TR310 are turned off and the Reed Relay RY301 is deactivated.

Figure 33

b) To eliminate the clicking noise when function switch is turned from AM to FM (or FM to PHONO 1, PHONO 1 to PHONO 2, etc.).

The switch Ss-6 is a shorting type and goes through a short-circuit condition when turning from 1 (AM) to 2 (FM), etc. (it is momentarily grounded). This turns TR311 off and TR312 on. Thus, Reed Relay RY301 is activated and output is cut off. The time constant of R341 and C330 allows the cut off condition to last for about one second (before C330 charges up to a point where TR311 turns on again, etc.). (Figure 33)
