PRECAUTIONS

1. Always disconnect the chassis from power line when soldering. Turning the power switch OFF is not enough. Power line leakage passing through the heating element may destroy the transistors and IC's.
2. Never attempt to do any work on the transistor amplifiers without first disconnecting the AC line cord and waiting until the power supply filter capacitors have discharged.
3. Replacements for output and driver transistors, if necessary, must be made from the same hfe rank as the original type.
4. If one output transistor burns out (open or short), always remove all output transistors in that channel and

check the bias adjustment, the control and other parts in the network with an ohm-meter before inserting a new transistor. All transistors in one channel will be destroyed if the base biasing circuit is open on the emitter end.

5. When mounting a replacement power transistor, be sure the bottom of the flange, the mica insulators and the surface of the heat sink are free of foreign matter, for they may cause transistors failure.
6. Silicon grease must be applied between the transistor and the mica insulator, and between the mica insulator and the heat sink for better heat conduction.

POWER AMPLIFIER BIAS ADJUSTMENTS

Instrument: DC milli-volt meter

- Set volume Control to minimum position.
- Set potentiometers VR601 and 602 to Clockwise position before starting this procedure.

1. Connect the plus lead of a DC milli-volt meter to test point T3 (on main amp., pcb) and minus lead to test point T1.

2. Adjust the potentiometer VR601 to obtain a 15mV reading on the DC milli-volt meter (see Figure 1.).
3. Repeat the above steps 1 and 2 for Right Channel. (use test points Pin No.T4, T2 and potentiometer VR602.)

Figure 1. Bias (Idling Current) Adjustment Hook-up

OVERLOAD PROTECTION LEVEL ADJUSTMENT

Instruments: Audio Generator and AC VTVM
Set Function Selector to AUX-1 position.
Be sure to make this adjustment with one channel driven.

1. Connect 4Ω 100W resistor to output terminal (speaker-1) (L) or (R), then connect AC VTVM in parallel.
2. Turn potentiometer for level adjustment VR603 (L-ch.) fully clockwise and VR604 (R-ch.) fully counterclockwise.
3. Connect audio generator to AUX-1 input terminal (L) or (R) and apply 1KHz (sine wave) signal. Adjust input level so that reading on AC VTVM is $21V^{*1}$.

4. Turn potentiometer VR603 or VR604 so that the Protection Relay is disengaged (when indication on AC VTVM is zero).
5. Adjust input level to confirm that the Relay remains activated when the output level is $19V^{*2}$
6. Proceed the above steps from 2 through 5 for the other channel.

- *1 In RA-612, VR603 and VR604 should be so adjusted that the Relay is disengaged when the output level is $20V/4\Omega$.
- *2 In RA-612, after finishing the adjustment, check that the Relay remains activated when the output level is $17.5V$.

METER CALIBRATION ADJUSTMENT (RA-812 only)

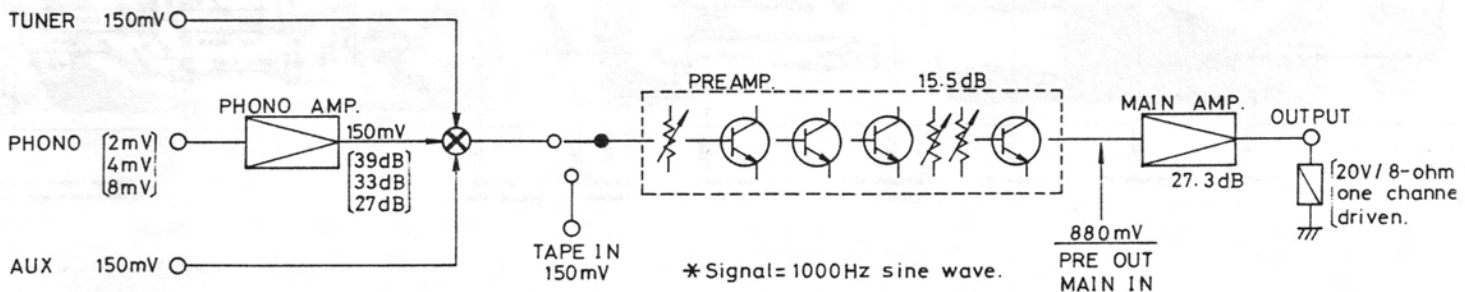

Instruments: Audio Generator and AC VTVM.
Set Function Selector to AUX-1 position.
Set Bass and Treble to "O" (Center) position or Tone Switch to Defeat position, and Muting, Loudness, Low and High Filter Switches to "OUT" position.

1. Connect 8Ω 50W resistors to right and left Speaker-1 terminals.
2. Connect AC VTVM in parallel with this 8Ω load of (L) or (R) channel.

3. Connect Audio Generator to input terminal of AUX-1 (L) or (R) channel and apply 1KHz (sine wave) signal. Adjust input level so that reading on AC VTVM is $2.83V$ ($1W/8\Omega$).
4. Turn and adjust VR605 (L-ch.) or VR606 (R-ch.) so that VU meter indicates 1W.
5. Then, increase input level by 10dB (output $10W = 8.94V/8\Omega$) and make sure that reading on VU meter is 10W.

GAIN DIAGRAM

RA-812

TROUBLE SHOOTING

- I. Both channels inoperative
 - A. If pilot lamp (or meter lamp) does not light, check AC fuse and
 - 1. If AC fuse is blown
 - a. Rectifier D903, 904, 905 or 906 may be short-circuited, or
 - b. Primary or secondary winding of power transformer may be short-circuited, or
 - c. Capacitor C001 or 002 may be short-circuited.
 - 2. If AC fuse is not blown (OK)
 - a. Power switch may be faulty, or
 - b. Primary winding of power transformer may be broken.
 - B. If pilot lamp (or meter lamp) does light, check +B and -B voltages.
 - 1. If no voltage at +B and -B.
 - a. Secondary winding of power transformer may be broken, or
 - b. Rectifier D903, 904, 905 or 906 may be open-circuited.
 - 2. If +B and -B voltages are present, check following item C.
 - C. Check if relay of Overload Protector is activated.
 - 1. If relay is activated when power switch is on
 - a. Contact of relay may be faulty.
 - 2. If relay stays disengaged, check DC fuse
 - a. If DC fuse is blown
 - (1) Main Amp. transistor Q601, 605, 609 or 611 may be faulty (or Q602, 606, 610 or 612 at R-ch.)
 - b. If DC fuse is not blown (OK)
 - (1) Output circuit may be short-circuited, or
 - (2) Relay may be faulty (disconnection of coil), or
 - (3) Transistor Q614 may be faulty (open).
- II. One channel inoperative
 - A. If DC fuse is blown
 - 1. Main Amp. transistor Q603, 605, 607 or 001 (Q604, 606, 608 or 613 at R-ch.) may be faulty.
 - B. If DC fuse is not blown (OK), check if input signal is supplied to Main Amp. input terminal.
 - 1. If input signal is not supplied to Main IN, terminal.
 - a. Check all transistors in Tone Control Amp.
 - b. Check all coupling capacitors in Tone Control Amp.
 - 2. If input signal is supplied properly.
 - a. C601 (R-ch. C602) may be faulty, or
 - b. Contact of Overload Protector Relay may be faulty.
- III. Overload protector inoperative
 - A. If Relay is disengaged or comes ON and OFF at the peak of signal.
 - 1. There may be excessive input, or
 - 2. Overload Detector Level may be miss-aligned.
 - B. If Relay is disengaged or comes ON and OFF at the small signal,
 - 1. Overload Detector Level may be miss-aligned.
 - C. If Relay does not deactivate at the excessive input or short-circuit of output circuit.
 - 1. Transistor Q614 for driving Relay may be short-circuited.
- IV. Hum and Noise
 - A. If there is hum at minimum volume
 - 1. Check each transistor in Main Amp.
 - 2. Check each coupling capacitor in Tone Amp.
 - B. If there is noise at minimum volume
 - 1. Check each transistor in Tone Amp.
 - 2. Check each coupling capacitor in Tone Amp.
 - 3. Check each resistor at collector, base and emitter ends of each transistor.
 - C. If there is hum or noise only in Phono Amp.
 - 1. IC401 or IC402 may be faulty, or
 - 2. Capacitor C401, 411 or 419 (R-ch. C402, 412 or 420) may be faulty.
 - D. If there is hum or noise only in MIC. Amp.
 - 1. IC501 may be faulty, or
 - 2. Capacitor C550, 553 or 555 may be faulty.
