1. BLOCK DIAGRAM

2. OPERATION OF COMPU-TREC (COMPUterized-Tape REsponse Control)

- Since the mechanism operations and electrical operations employed in D-970 are similar to those of D-570, back tension servo operation is similar to that of D-550M, the explanations of these operations are omitted from this manual.

Fig. 2-1 oIC3b comparator input terminal level

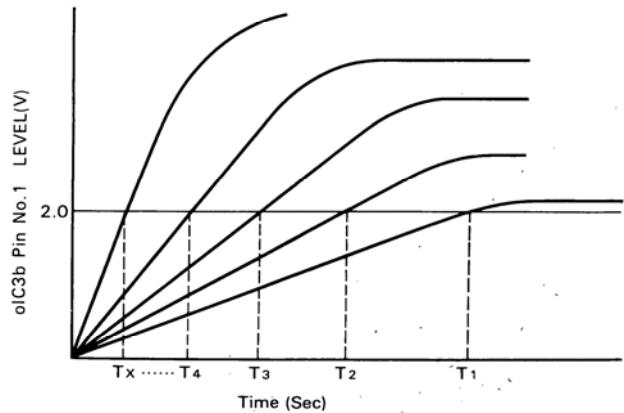

Fig. 2-2

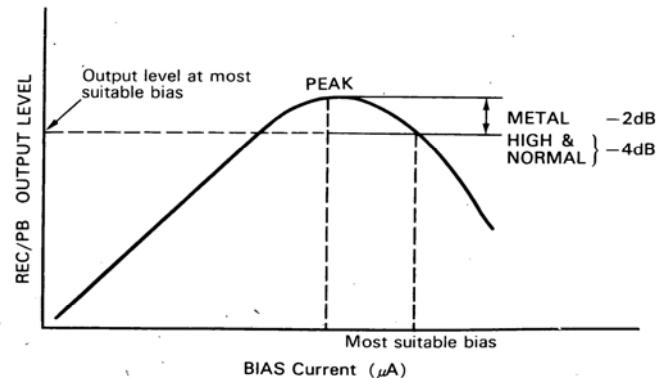

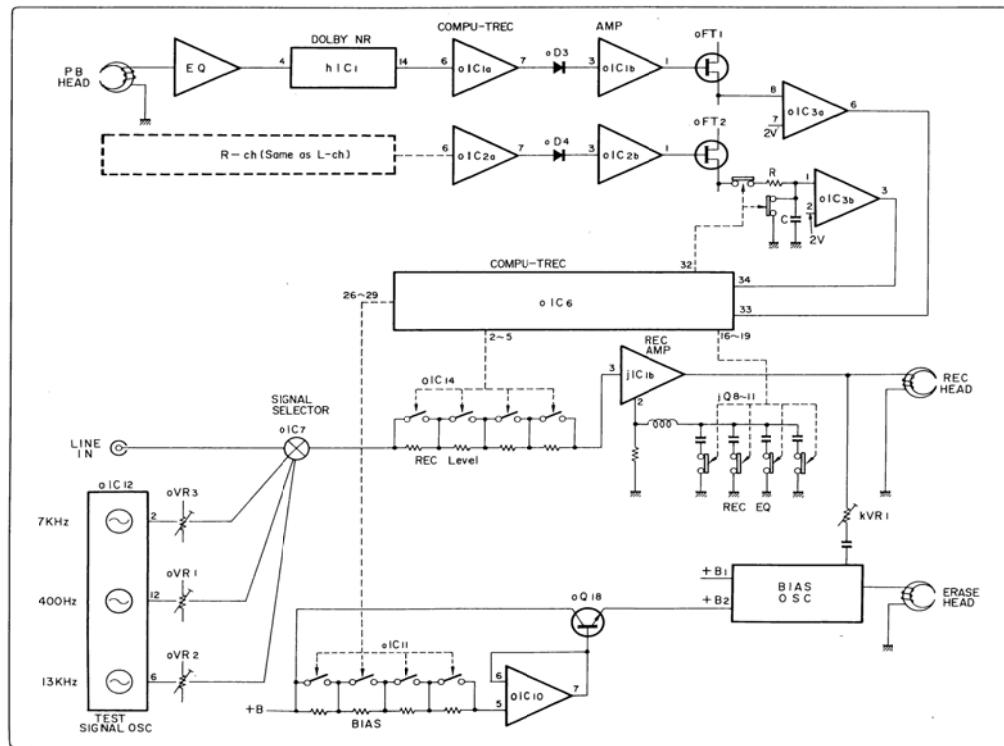

Fig. 2-3 Block diagram of COMPU-TREC

COMPU-TREC system can be conformity with individual factors (bias current, rec level and rec equalizer) of each cassette tape for the purpose of exhibiting most suitable characteristics automatically and speedily. Therefore, it corrects uneven frequency response and error of rec level, it supports stable operation of dolby noise reduction and so on.

2-1. Operation of Bias Current Control

- When the START button is pushed after pushing CLEAR button, and the COMPU-TREC operation starts. On and after step 2) are all automatic operation.
- Test signal is changed from 400 Hz to 7 kHz signal, and REC & PLAY BACK operation start.
- At the same time, bias current is changed from minimum to maximum by resistor (oR66 ~ 69) step by step (16 steps).
- On each step, 7 kHz signal is record, and play back signal is detected by R-ch, it is inputted to the comparator (oIC3b) through the diode (oD4) and integral circuit.
- The voltage of pin 2 (oIC3b) is 2 V constant.
- Therefore, it takes (T) seconds to rise the voltage of pin 1 (oIC3b) up to 2 V, and to apply output (oIC3b) signal. (See Fig. 2-1)
- Since the bias current level influences to the record/playback level, the rise time (T) is also changed. (See Figs. 2-1, 2-2)
- At maximum record/play back level, then the rise time is minimum.

- oIC6 (μ PD546C) memorize the relation of rise time and bias current on each step, since it control over bias level to apply maximum record/play back level, level of realizing the rise time that and (Tbest) time equal.

2-2. Operation of Rec Level Control

Rec Level adjustment starts after "2-1. Bias current control" automatically.

- Test signal is changed from 7 kHz to 400 Hz signal.
- Record and play back level is changed from minimum to maximum by resistor (JR9 ~ 12) step by step (16 steps).
- On each step, 400 Hz signal is record, and play back signal are inputted to pin 8 (oIC3a) and pin 1 (oIC3b) through diode (oD3, oD4) and integral circuit.
- The voltage of pin 8 and 1 (oIC3) rise up to 2 V, then oIC6 memorize the rec level as most suitable level.

2-3. Operation of Rec Equalizer Control

Rec equalizer adjustment starts after "2-2. Rec level control" automatically.

- Test signal is changed from 400 Hz to 13 kHz signal.
- Rec equalizer changed 16 steps by capacitor (JC14 ~ 17) of rec amplifier. (See Fig. 2-3)
- On each steps, 13 kHz signal is record, and play back signal are inputted to pin 8 and 1 (oIC3) through diode (oD3, 4) and integral circuit.
- The voltage of pin 8 and 1 (oIC3) rise up to 2 V, then oIC6 memorize the rec equalizer as most suitable equalizer.
