

OPERATING INSTRUCTIONS & SERVICE MANUAL

STEREO RECEIVER

SANSUI SEVEN

Sansui

SANSUI ELECTRIC CO., LTD.

Congratulations on joining the thousands of proud, satisfied owners of quality stereo components from Sansui, Japan's foremost audio-only specialist.

In many ways, the SEVEN is a culmination of our long experience and arduous research in the design and manufacture of quality audio-only equipment.

Its tuner section combines an FET-equipped super sensitive FM frontend and an IC-equipped FM IF amplifier which ensures outstanding FM selectivity and superb tone quality.

Its amplifier section is a 160-watt masterpiece designed, tested and proven to bring out every subtle shade of the original sound, regardless of the program source, free from distortion.

Over-all, the receiver is equipped with practically all the switches, controls, inputs and outputs that you would ever need to enjoy today's most advanced hi-fi sound reproduction.

This manual has been prepared to guide you in operating and caring for the receiver correctly, so that you will get the most out of its built-in high performance and exceptional versatility. May we suggest that you read it once carefully?

SWITCHES AND CONTROLS

Noise Filter Switches
Explained on the right are the functions of the various switches and controls located on the front panel of your SEVEN. They are all designed and located to give you maximum control of the receiver with the greatest ease. Read the instructions once and you'll find every one of them is very easy to operate.

The Operating Instructions Sheet, accompanying this booklet, carries the same information in a condensed form, for future quick references.

Power Switch
Push once to turn on the power supply for the entire receiver, once more to turn off.

Power Indicator

Headphone Jack
Accommodates a stereo headphone set for monitoring and private listening. When listening with headphones, turn the Speaker Selector to 'OFF.' The headphones used should be a dynamic type.

Speaker Selector
OFF: To cut off the sound from the speaker systems when listening with headphones.
A: To drive the speaker systems connected to the SYSTEM A terminals.
B: To drive the ones connected to the SYSTEM B terminals.
C: To drive the ones connected to the SYSTEM C terminals.
A+B: To drive both A and B pairs of speaker systems.
A+C: To drive both A and C pairs of speaker systems.

Tuning and Signal Meters
The desired FM station is pinpointed when the Signal Meter pointer has swung as far to the right as possible and the Tuning Meter pointer is perfectly centered. An AM station, in contrast, is correctly tuned in when the Signal Meter pointer has swung as far to the right as it will go. You need not pay attention to the Tuning Meter.

Triple Tone Controls
BASS: Use to strengthen or weaken the receiver's low-end response. Turn it clockwise to emphasize the lows by 3dB per step.
MIDRANGE: Use to strengthen or weaken the midrange response. Turn it clockwise to emphasize the midranges by 1dB per step.
TREBLE: Use to strengthen or weaken the high-end response. Turn it clockwise to emphasize the highs by 3dB per step.

Loudness Switch
The human ear is such that an apparent 'drop-out' of the lows and highs occurs when you're listening at a low volume level. Pushing this switch compensates for this apparent loss and appropriately accents the lows and highs.

FM Stereo Indicator
Lights when the receiver is tuned to an FM station broadcasting in stereo.

Mono Switch
Push to hear in mono whatever program source you may have adjusted the receiver to reproduce.

Function Indicators

Tape Monitor Switches

These switches control tape monitor circuits 1 and 2. See p. 9 of Operating Instructions for detailed instructions on the operation of tape decks.

4-Channel Adaptor Switch

If you connect a 4-channel adaptor to the SEVEN and make other necessary connections, you will be able to upgrade this 2-channel stereo receiver to 4-channel stereo capabilities by pushing this switch (refer to p. 10 of Operating Instructions). Otherwise, be sure to keep it off.

FM Muting Release Switch

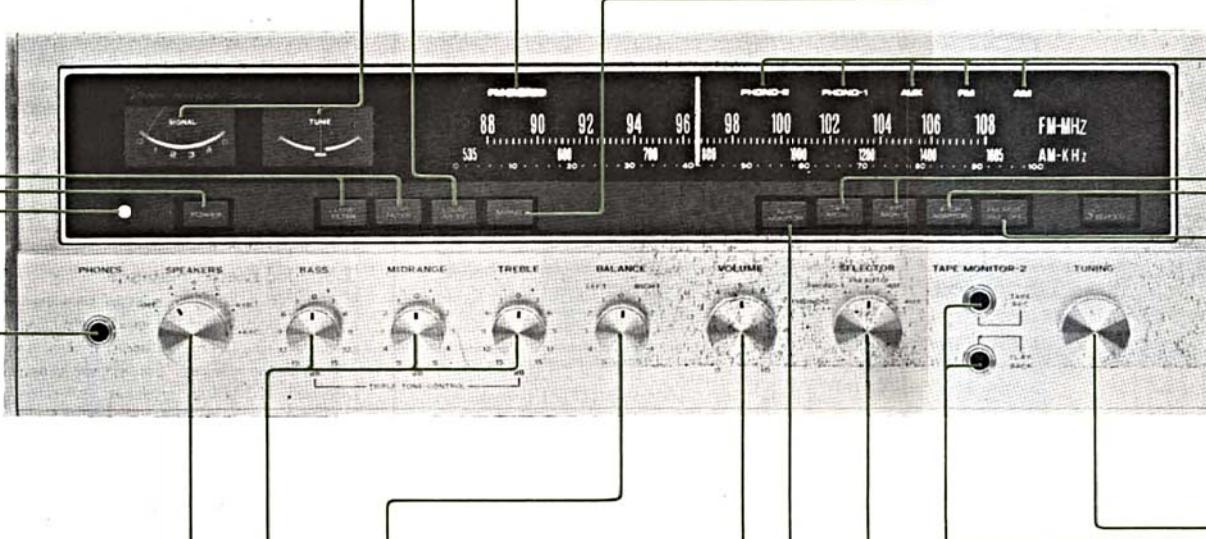

This switch, if not depressed, eliminates the inter-station noise commonly heard when tuning on the FM band. It should be pushed to release the muting function when you are trying to tune in a weak FM station.

Tuning Control

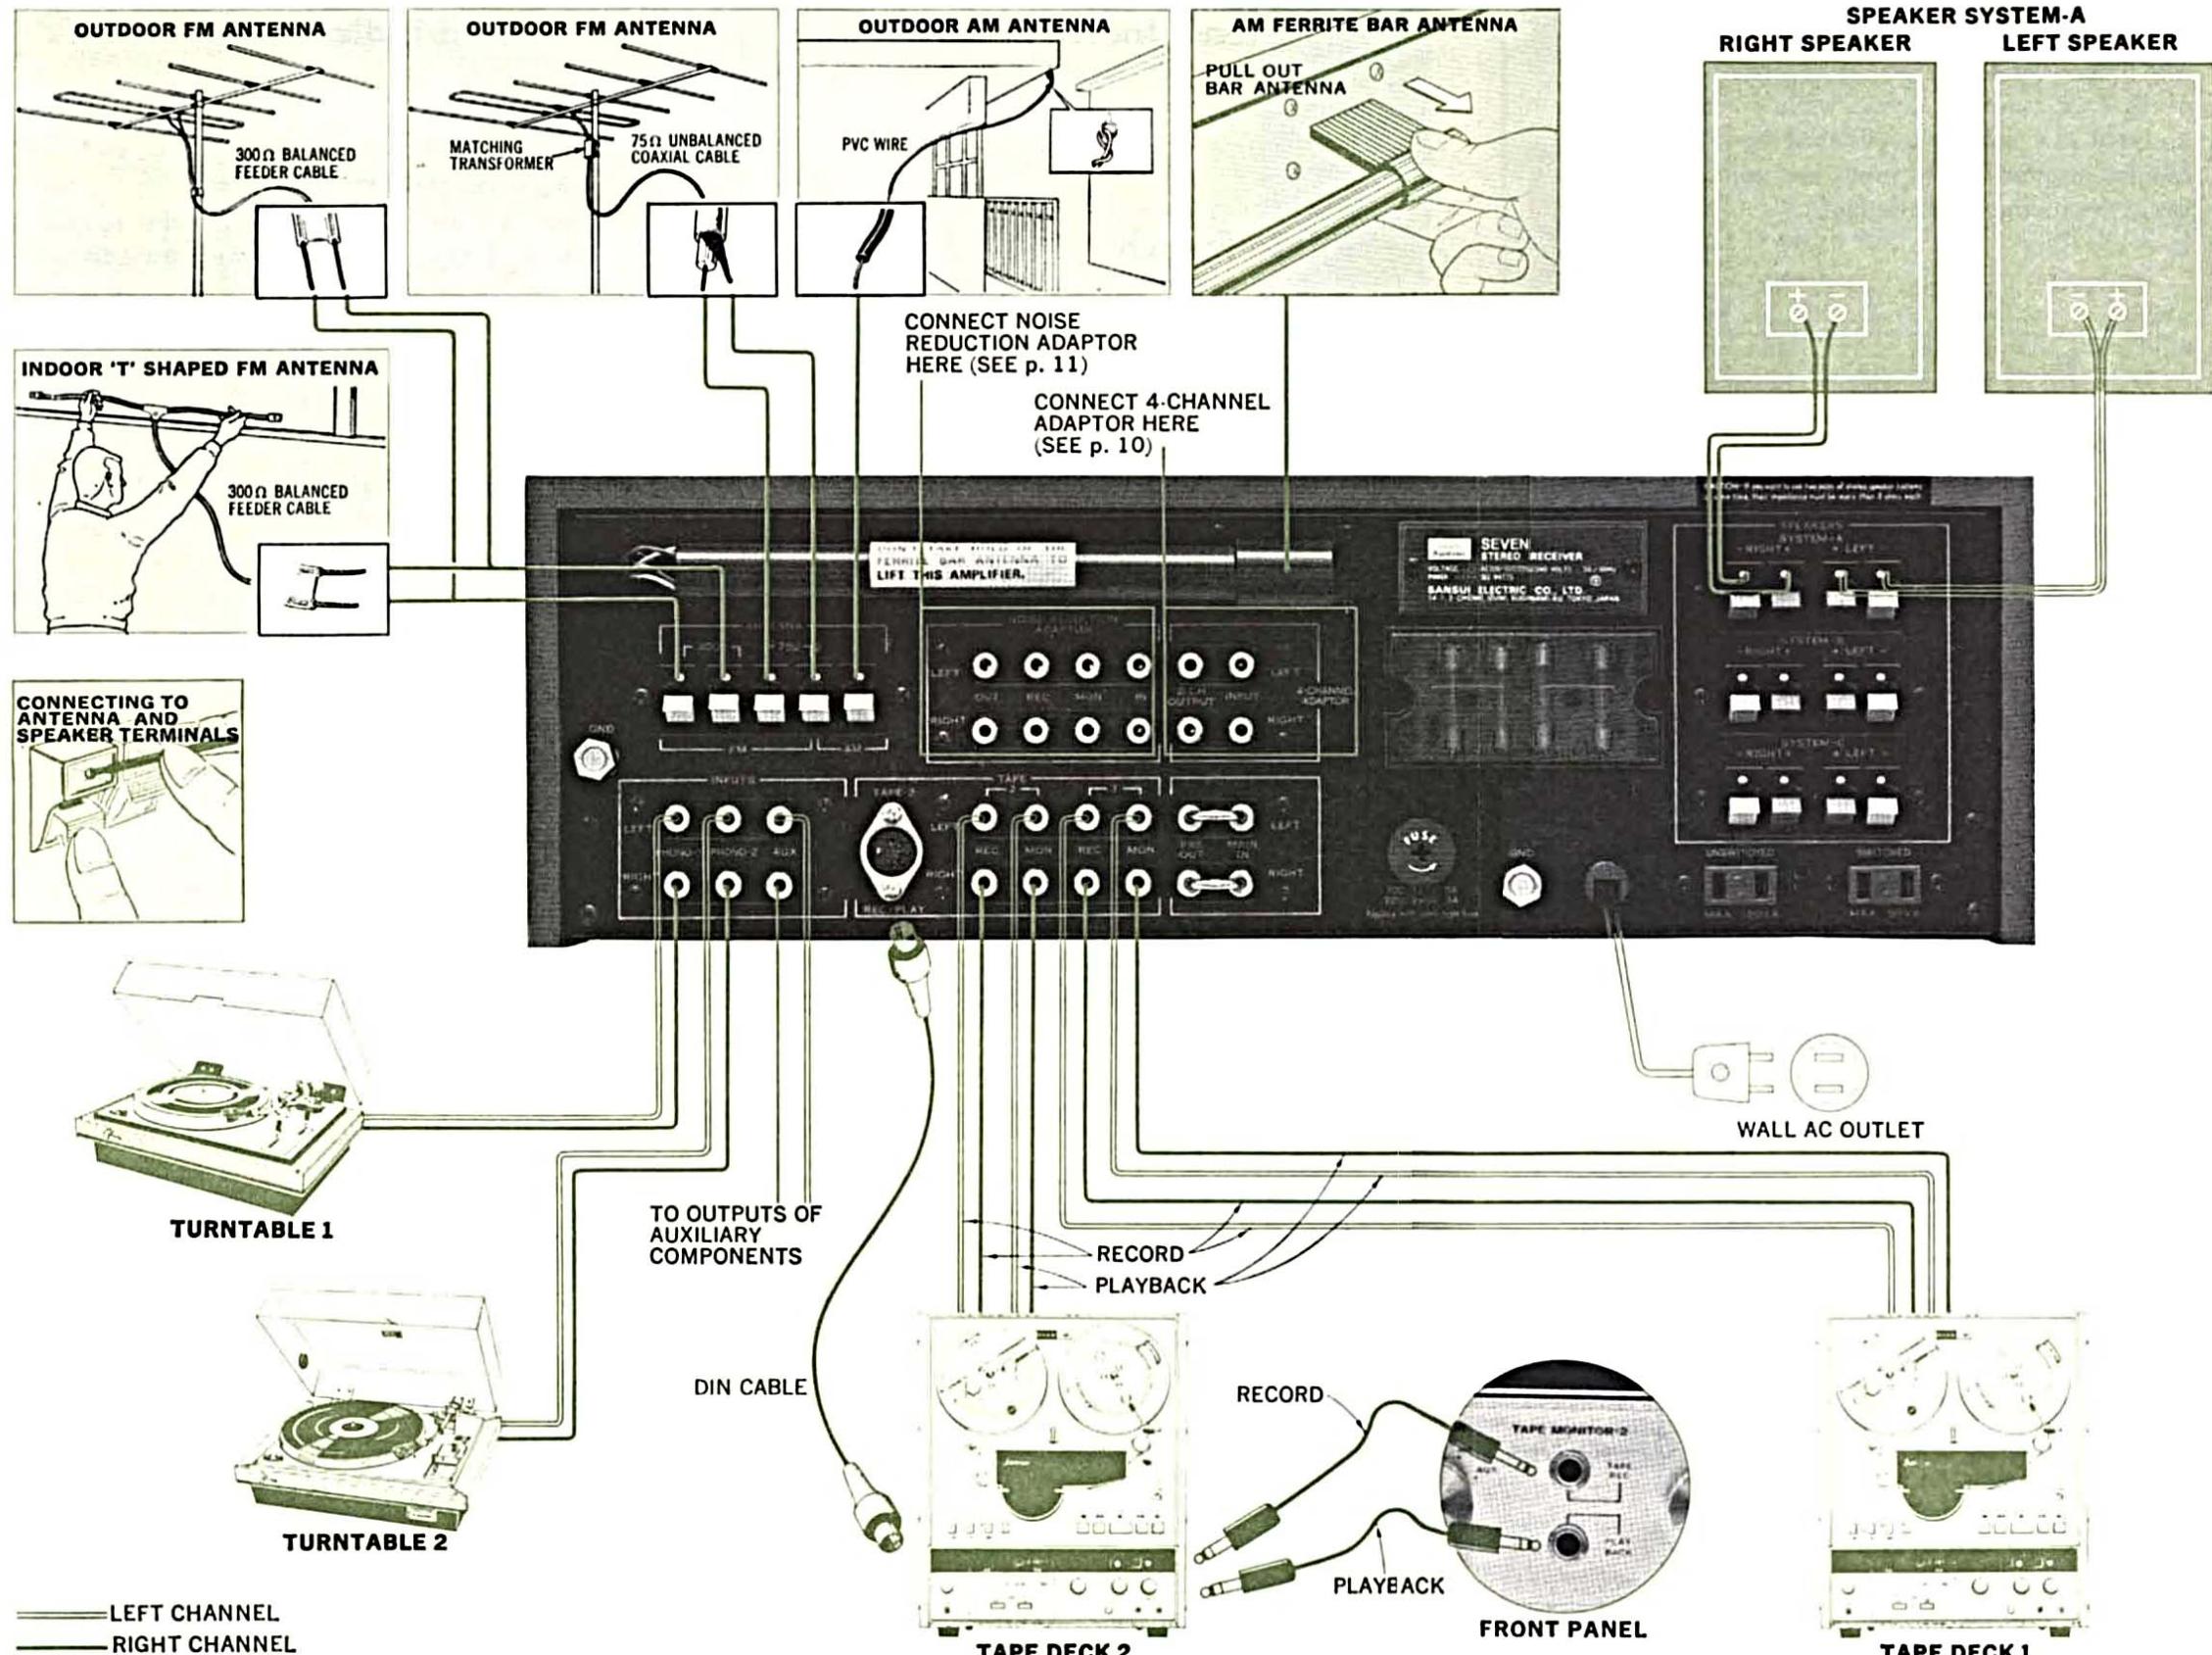

Tune in the desired station by turning this control.

Tape Monitor-2 Jacks

A part of tape monitor circuit 2, these jacks connect a tape deck with phone plugs. The upper jack is for recording, and the lower one for playback. Connecting a tape deck here automatically disables the pin jack terminals and DIN connector socket of tape monitor circuit 2 on the receiver's rear panel.

CONNECTIONS

Connecting Speaker Systems

The SEVEN connects up to three pairs of speaker systems. Any pair may be driven independently or a combination of two pairs may be driven, as selected by the Speaker Selector. Connect them to the receiver as instructed in the diagram on the left, taking care not to confuse the left and right channels and the plus and minus leads. Also, be very careful not to short-circuit the plus and minus leads.

About the Speaker Impedance

Each speaker system connected to your SEVEN must possess an impedance of 4 to 16 ohms. Should you wish to drive two pairs of speaker systems simultaneously (by turning the Speaker Selector to the 'A+B' or 'A+C' position), each of them must have an impedance of 8 ohms or more.

Connecting Antennas

FM Antennas

T-Shaped Feeder Antenna

If you live in the proximity of broadcast stations, quality reception can be usually obtained by just setting up the T-shaped feeder cable antenna supplied with the receiver. Connect the antenna to the receiver's FM 300Ω terminals, set up the receiver for FM reception, stretch the antenna to a full T shape, and adjust its height and direction until the best reception is obtained.

Outdoor FM Antenna

Should the feeder cable antenna described above fail to give you a clear reception, try installing an outdoor FM antenna.

While many different types of antenna are commercially available, it is advisable to use one with at least 5 or 7 elements.

Using feeder cable, connect such antenna to the FM 300Ω antenna terminals of the receiver. Observe the following suggestions when connecting it:

1. As an antenna is directional, locate and orient the antenna in the place and direction which give you the best reception. Actually listen to your favorite FM station while you make the adjustments.

2. Be sure not to let the antenna touch electric cables and other objects.
3. Arrange the route of the feeder cable so as to keep it as short as possible.
4. Try to keep the antenna as far from streets as possible to prevent picking up the noise generated by automobiles.

If you should need long feeder cable to connect the antenna or where the automobile traffic is heavy, it is advisable to employ 75Ω coaxial cable. In this case, however, it is necessary to connect a matching transformer between the antenna and the coaxial cable to match their impedances. Be sure to connect the cable to the FM 75Ω terminals. (If the antenna itself has an impedance of 75Ω , no matching transformer is needed.)

AM Antenna

Ferrite Bar Antenna

The highly sensitive AM ferrite bar antenna, provided on the rear of the receiver, is usually sufficient to obtain a quality reception of AM stations. To use, simply pull it out as illustrated.

Outdoor AM Antenna

Should the bar antenna fail to give you a clear reception, however, connect a piece of PVC wire supplied to the AM-A terminal on the receiver's rear panel and extend it outside a window or on the roof. Still better results can be obtained if you ground the receiver.

Connecting Turntables

As the SEVEN is equipped with two phono input circuits, it is possible to employ two turntables or two tonearms with magnetic cartridges.

Connect the output cables of the turntable to the PHONO 1 or 2 input terminals. Be sure to keep the left and right channel cables in proper order.

Note:

1. If you wish to use a moving-coil (MC) type cartridge, be sure to employ either a step-up transformer or separate head amplifier between the turntable and the SEVEN.
2. If you wish to use a ceramic or crystal type cartridge, connect the outputs of the turntable to the receiver's AUX input terminals.

Connecting Tape Decks

The SEVEN is provided with two tape monitor circuits. One has pin jack terminals, while the other has pin jack terminals, a DIN connector socket and phone type jacks. If you are connecting only one tape deck, you are absolutely free to use any terminals which are most convenient to you. But if you are connecting two tape decks, be sure to connect one of them to the first tape monitor circuit, and the other to any terminals of the second tape monitor circuit.

If Using Pin Jacks

If you are using the pin jack terminals to connect your tape deck, proceed as follows:

1. Connect a pair of shielded cables between the 'TAPE 1 (or 2) REC' pin jack terminals of the SEVEN and the recording input terminals of your tape deck.
2. Connect another pair of such cables between the receiver's 'TAPE 1 (or 2) MON' pin jack terminals and the tape deck's playback (monitor) output terminals.

Note: If you don't connect a 4-channel adaptor to the 4-CHANNEL ADAPTOR terminals on the rear panel, you may connect another tape deck to them. Use the 2-CH OUTPUT terminals as recording outputs, and INPUT terminals as playback inputs.

If Using the DIN Socket

In the rather unlikely event that your tape deck is equipped only with a DIN connector socket, plug the DIN connector cable extending from it into the 5-pin DIN connector socket (marked TAPE-2 REC/PLAY) on the receiver's rear panel.

If Using Phone Jacks

Should your tape deck be equipped with cables with phone type plugs, you may connect it to the phone jacks on the receiver's front panel. The tape deck's recording input plug should be inserted into the upper 'TAPE REC' jack, and its playback output plug into the lower 'PLAYBACK' jack.

Connecting a tape deck to the phone type jacks automatically disables the pin jack terminals and DIN connector socket of the second tape monitor circuit.

OPERATIONS

FM Reception

1. Set the Selector Control to 'FM AUTO.'
2. Tune in the desired FM station by turning the Tuning Control.
It is correctly pinpointed when the Signal Meter pointer has swung as far to the right as possible and the Tuning Meter pointer is accurately centered.
3. Use the various other controls and switches to suit your personal preference.

AM Reception

1. Set the Selector Control to 'AM.'
2. Tune in the desired AM station by turning the Tuning Knob until the Signal Meter pointer swings as far to the right as it will go near the frequency of that station. The Tuning Meter dose not operate for AM.
3. Use the various other controls and switches to suit your personal preference.

Playing Records

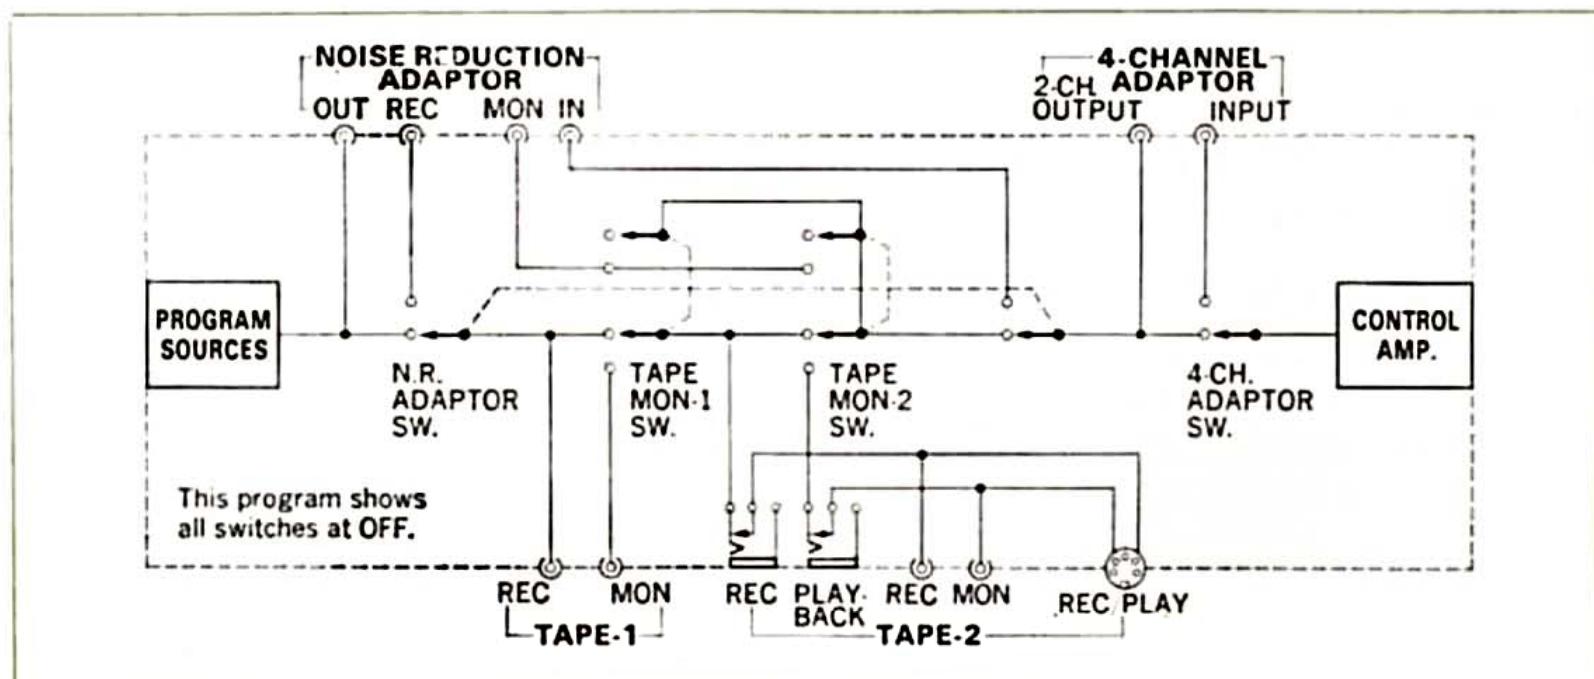

1. Set the Selector Control to 'PHONO-1' or 'PHONO-2,' depending on which input circuit you are using.
2. Start the turntable and play the record.
3. Use the various controls and switches to suit your personal preference.

Recording and Playback on Tape Decks

To Record into a Tape Deck

1. Set the receiver's Selector Control to the program source you want to record.
2. Start the tape deck in the recording mode.

Signal Path Diagram of Tape Record/Playback Circuit

3. To monitor the sound being recorded, push the TAPE MON 1 or 2 Switch, depending on which of the two tape monitor circuits is accommodating the tape deck at the moment.

Note: Monitoring is possible only if the tape deck is equipped with separate heads for recording and playback.

To Reproduce a Recorded Tape

1. Push the TAPE MON 1 or 2 Switch, depending on which of the two tape monitor circuits is accommodating the tape deck at the moment.
2. Start the tape deck in the playback mode.
3. Use the various controls and switches to suit your personal preference.

Recording into Two Tape Decks Simultaneously

1. Set the Selector Control to the program source you want to record.
2. Start both tape decks in the recording mode.

Recording from One Tape Deck into the Other

1. Push the TAPE MON 1 Switch.
 2. Start the tape deck connected to the second tape monitor circuit, in the recording mode.
 3. Now start the other tape deck (conneted to the first tape monitor circuit) in the playback mode.
- Note:** The copying (dubbing) of a recorded tape, as described above, is only possible from a tape deck connected to the first tape monitor circuit to the one connected to the second tape monitor circuit.

4-CHANNEL STEREO SYSTEM

4-CHANNEL STEREO

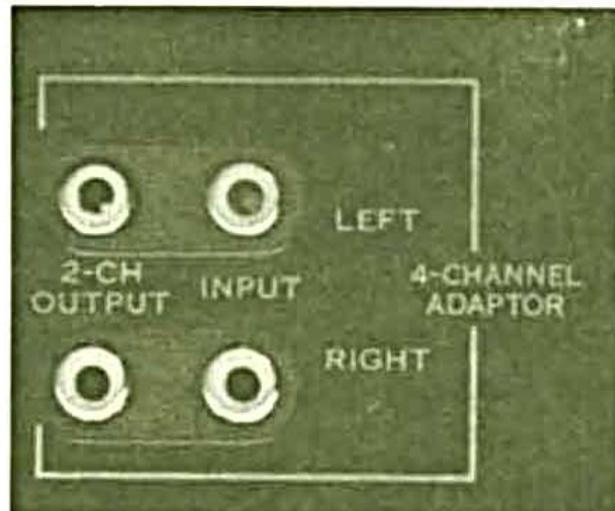

The sound we daily hear is a mixture of the sounds that reach our ears straight from the sound source—be it a musical instrument, a jet, a man's mouth or what have you—and the 'indirect sounds' that arrive at our ears only after they are reflected off various surfaces, such as the walls, ceiling and so forth. Four-channel recordings are made using two microphones in the front of the concert hall and two in the rear (to simplify the explanation). The 'indirect sounds' with their complicated waveforms are mainly picked up by the two rear microphones and reproduced out of the two rear speakers in a 4-channel stereo set-up for greatly enhanced 'ambience' effects. The result is almost as if the original live performance were re-played right in your own room. This new approach can now be yours simply by adding certain equipment—mainly, a Sansui 4-channel rear amplifier and a second pair of speaker systems—to your 2-channel stereo system.

SANSUI 4-CHANNEL REAR AMPLIFIER QS-500

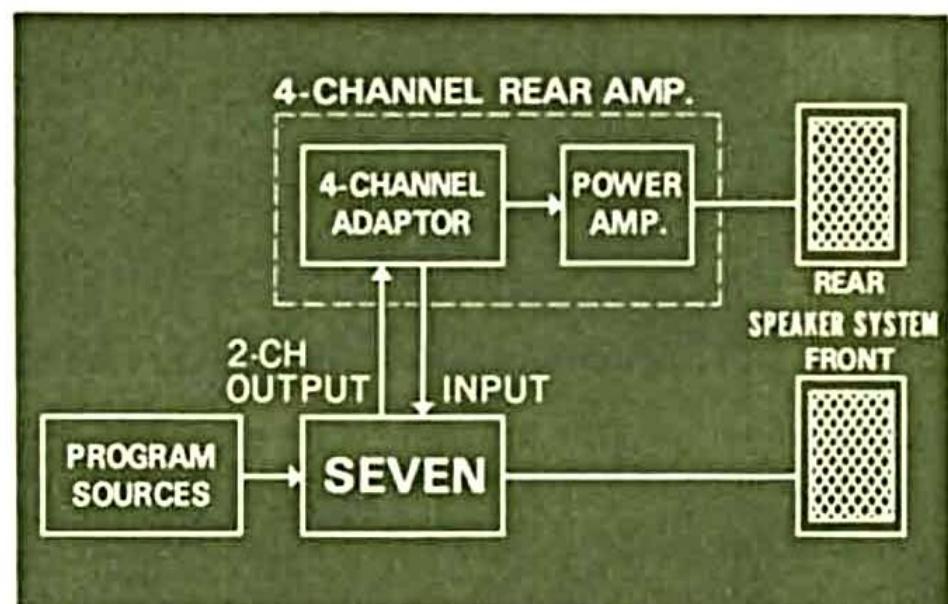

Connecting a 4-Channel Adaptor

Connection of such a rear amplifier or 4-channel adaptor is easy. Just connect the 4-CHANNEL ADAPTOR 2-CH. OUTPUT terminals of your SEVEN with the input terminals of such rear amplifier or 4-channel adaptor, then connect its 4-CHANNEL ADAPTOR INPUT terminals with the output terminals of such unit.

Operation

To operate the rear amplifier or 4-channel adaptor so connected, push the 4CH ADAPTOR Switch on the receiver's front panel, and otherwise follow its manufacturer's instructions.

NOISE REDUCTION SYSTEM

About Noise Reduction Systems

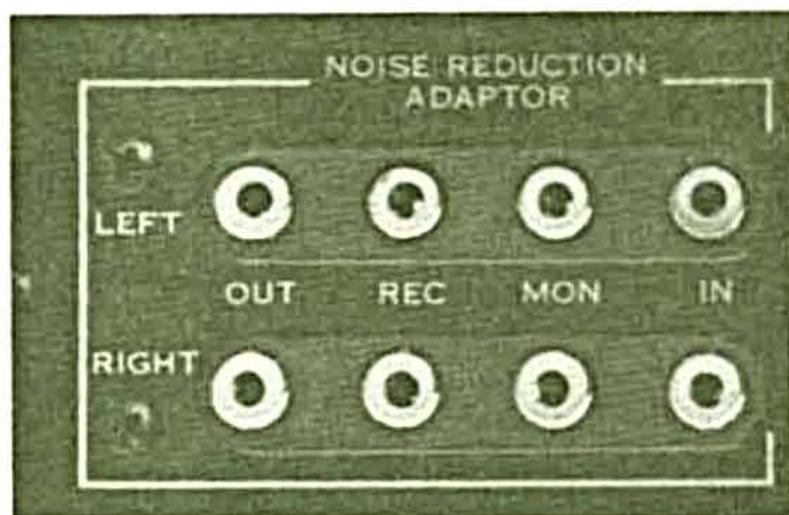

Tape hiss is the single greatest annoyance to tape recording enthusiasts. To eliminate this noise, several noise reduction systems have been developed to date.

The latest innovation in this area is called the Dolby system, which reduces tape hiss most effectively without affecting the tone quality of the program source sound. It involves compressing low-level signals (where tape hiss is most annoying) during recording and then expanding them during playback in exactly the opposite manner.

The Dolby system often more than doubles the stereo listening enjoyment. To take maximum advantage of it, you only need couple a commercially available Dolby Noise Reduction Adaptor to your SEVEN.

Connecting a N.R. Adaptor

Connect the Noise Reduction (N.R.) Adaptor to the NOISE REDUCTION ADAPTOR jacks on your SEVEN.

Such adaptor usually has four pairs of jacks—two for connecting a tape deck, and two more for connecting an amplifier (in this case the SEVEN).

However, as your SEVEN is equipped with provisions for connecting up to two tape decks, it is better to connect your tape deck(s) to the SEVEN (refer to 'Connecting Tape Decks' on page 8).

With your tape deck(s) so connected, regard the NOISE REDUCTION ADAPTOR-OUT, -IN, -REC and -MON jacks on your SEVEN's rear panel as equivalent to these terminals:

OUT ... Tape recording output jacks of an amplifier.

IN Tape playback input jacks of an amplifier.

REC ... Recording input jacks of a tape deck.

MON... Playback output jacks of a tape deck.

With this in mind, make these connections between the SEVEN and the n.r. adaptor:

SEVEN N.R. Adaptor

OUT ... Input jacks of its recording circuit.

REC ... Output jacks of its recording circuit.

MON... Input jacks of its playback circuit.

IN Output jacks of its playback circuit.

Operating a N.R. Adaptor

Operate the n.r. adaptor correctly according to the instructions supplied by its manufacturer. Then it is simply a matter of operating your tape deck correctly for recording and playback and pushing the N.R. ADAPTOR Switch on the SEVEN's front panel.

Note: When you are recording via a two-circuit type Dolby Noise Reduction Adaptor, changing its mode switch from record to playback by mistake is likely to cause a loud oscillating phenomenon. Be very careful to avoid such mistake.

SIMPLE MAINTENANCE HINTS

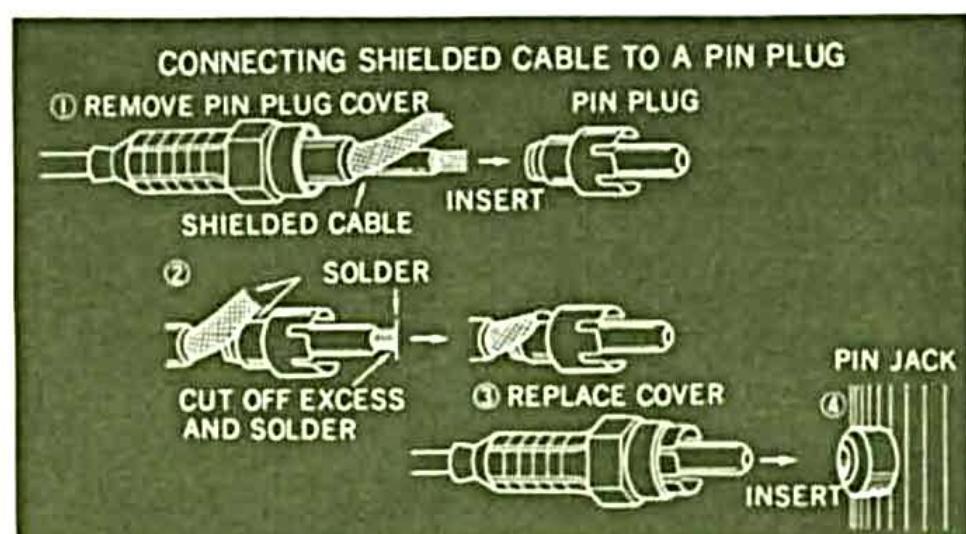

About the Place of Installation

The wooden cabinet of the SEVEN is designed so that any heat radiated inside will effectively escape through it. Proper care should therefore be taken of the dissipation of such heat if you wish to place something on top of the receiver or place it inside a closed box, etc. Above all, avoid placing it where it may be exposed to the direct sunlight.

When Connecting a Turntable, etc.

To connect a turntable, tape deck and so forth, it is strongly recommended to use thick, shielded cables with minimal distributed capacitance and to keep them as short as possible.

To solder the pin plugs supplied as accessories onto such shielded cables, refer to the illustration below.

Hum and Howling

Care must be taken never to place a turntable on or too near a speaker system, or the vibration of the speaker system is transmitted and causes howling. It is best to keep these components completely separate but if this is impossible, place a thick cushion between them.

Humming is a phenomenon caused by incomplete or incorrect turntable-receiver connections. Should this occur, check to see if all connections are completely made and if the connecting cables are sufficiently thick. Be sure to connect the grounding lead (or terminal) of the turntable to the GND terminal of the SEVEN. It may suppress the hum noise which may otherwise occur.

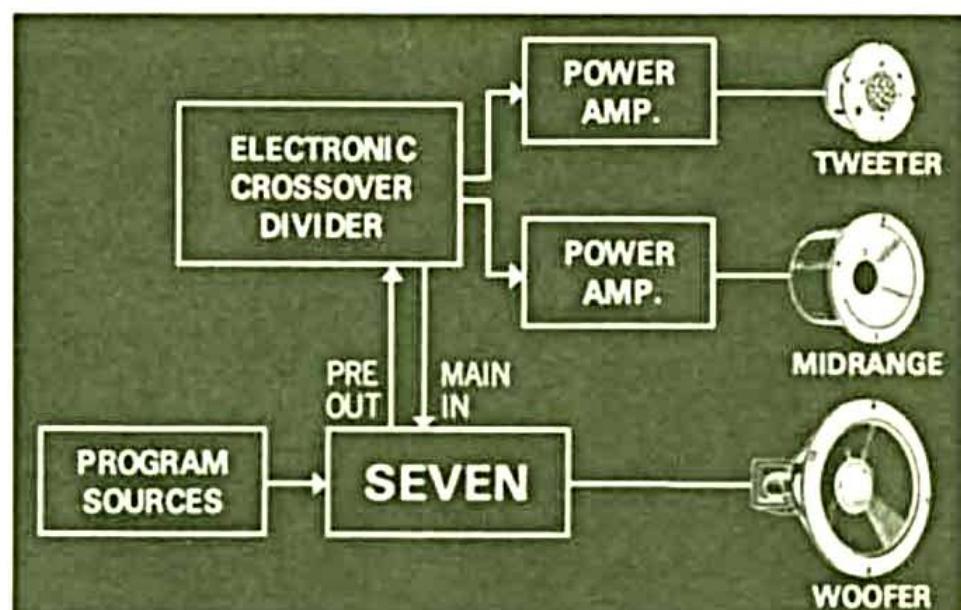

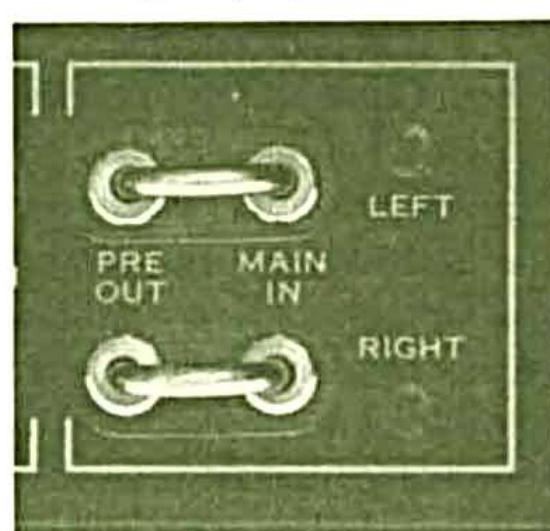

PM Connectors

These are the U-shaped jumper connectors connecting the 'PRE OUT' (preamplifier output) jacks and the 'MAIN IN' (power amplifier input) jacks on the receiver's rear panel, and can be easily pulled out. With these connectors unplugged, the preamplifier and power amplifier sections are separated and may be independently used. For example, a different power amplifier may be coupled to the 'PRE OUT' jacks.

Separating the preamplifier and power amplifier sections makes it possible to upgrade your stereo system further by adopting the 'electronic crossover system,' among other things.

Note:

1. Be sure to leave the PM connectors firmly plugged in unless you want to separate the preamplifier and power amplifier sections for some purpose.
2. Turn off the Power Switch without failure before you plug in or out the PM connectors.

SIMPLE MAINTENANCE HINTS/ACCESSORIES

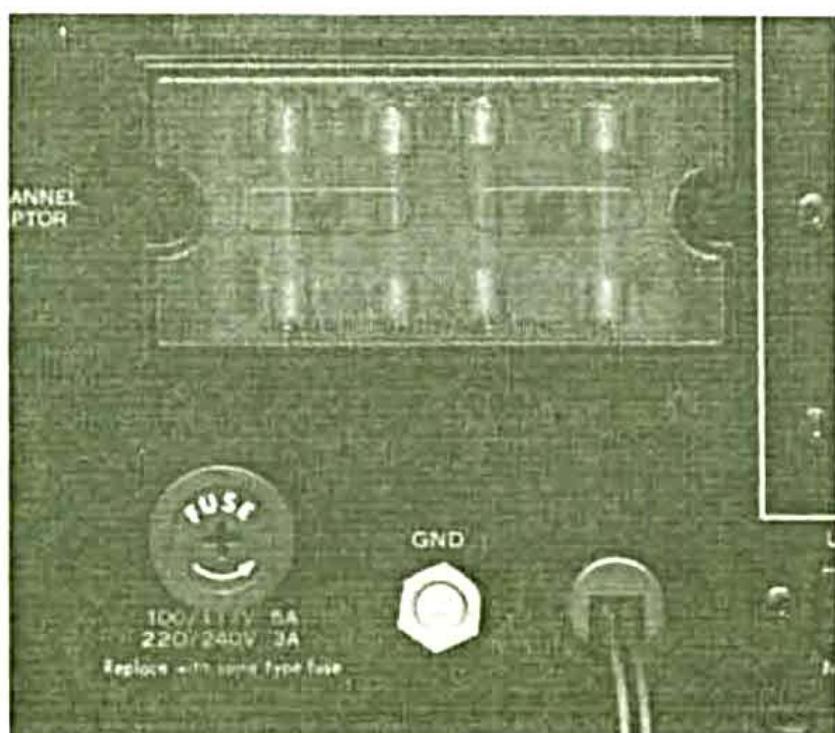

Quick-Acting Fuses

The SEVEN's power transistors are protected by four quick-acting fuses. They are located on the rear panel of the receiver, concealed inside a plastics cover.

When a Function Indicator is glowing, if no or distorted sound comes out of one or both of the speaker systems, examine their connections and your operating procedure once. If nothing is wrong with them, it is possible that one or more of the quick-acting fuses have blown. Should this happen, disconnect the power cord from the wall AC outlet immediately, then remove the metal cover by loosening the two screws securing it to the rear panel, and check the four quick-acting fuses. If you find any of them blown, discover and eliminate the cause of the blowout, and replace it with a new 4-ampere quick-acting fuse supplied. Probable causes of the blowout include excessively large input signals and a short-circuit at the speaker terminals.

Should the Power Fuse Blow

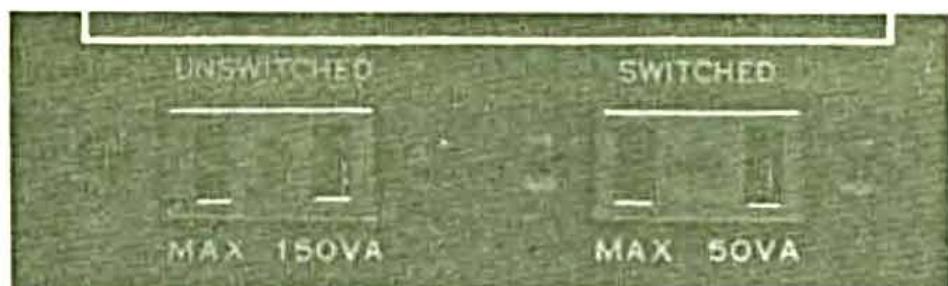

If no Function Indicator should glow and the receiver simply remains dead even after you have turned on its Power Switch, it is possible that its power fuse has blown. If this happens, disconnect the power cord from the wall AC outlet at once and examine the power fuse on the receiver's rear panel. If you find it blown, replace it with a new glass-tubed fuse of the rated capacity (5-ampere for 100 to 127 volts, 3-ampere for 220 to 250 volts). Never use a fuse of a different capacity or a piece of wire, even as a stop-gap measure, or serious danger could result.

Rear-Panel AC Outlets

Of the two AC outlets provided on the rear-panel, the one marked 'SWITCHED' is controlled by the front-panel Power Switch. The other, marked 'UN-SWITCHED,' is always 'live' and independent of the Power Switch. The voltage delivered at these outlets is the same as the power supply voltage used.

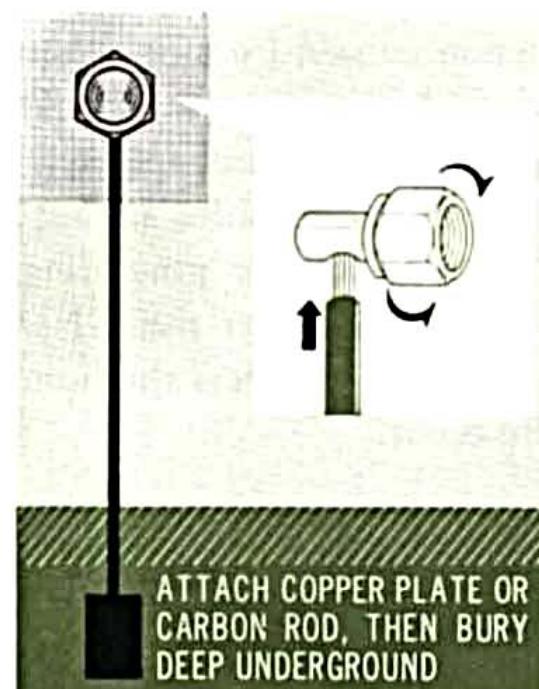

The 'SWITCHED' and 'UNSWITCHED' outlets have a power capacity of 50 VA and 150 VA, respectively. Before you connect any appliance to them, be sure that it is adjusted for use at the same power supply voltage, and that its power consumption is not beyond these figures.

Grounding

Any noise picked up by the connecting cables can be effectively grounded by connecting a piece of PVC (polyvinyl chloride) or enameled wire to the 'GND' terminal on the SEVEN's rear panel, attaching a small copper plate or carbon rod to the other end and burying it deep underground. The grounding leads of other equipment in your stereo system may be connected to the same terminal to ground the entire system at once.

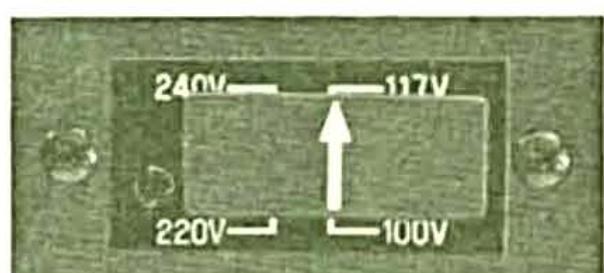

If you have connected an external AM antenna to the receiver, it is advisable to ground it at the same time.

Voltage Adjustment

In order to permit the use of your SEVEN in any part of the world, it is equipped with a Voltage Selector. It is set to the correct power supply voltage of your area prior to shipment, so there is no need to touch it. However, should you move after purchasing the unit and find the power supply voltage is different, simply reset the selector as follows:

1. Remove the two screws securing the name plate on the unit's rear panel, then remove the name plate.
2. Unplug the Voltage Selector once, and reset it so that the arrow mark on it faces the correct voltage indication. Change the power fuse also whenever the power supply voltage has changed. For 100/117 volt operation, use a 5-ampere glass-tubed fuse. For 220/240 volt operation, use a 3-ampere one.
3. Where the power supply voltage considerably fluctuates, the Voltage Selector may be reset to avoid unpleasant side effects of such fluctuation. Reset it to the voltage immediately higher than the peak of the fluctuation.

About Servicing

If anything should ever go wrong with your SEVEN, or if you have any question about it, please contact the Sansui dealer from whom you purchased it or your nearest Authorized Sansui Service Station.

GENERAL TROUBLESHOOTING CHART

If the receiver is otherwise operating satisfactory, the more common causes of trouble may generally be attributed to the following:

1. Incorrect connections or loose terminal contacts. Check the speakers, turntable, tape deck, antenna and power cord.
2. Improper operation. Before operating any audio com-

ponent, be sure to read its manufacturer's instructions.

3. Improper location of audio components. The proper positioning of components, such as speakers and turntable, is essential to maximum stereo enjoyment.

4. Defective audio components.

The following are some other common causes of malfunction and what to do about them.

PROGRAM	SYMPTOM	PROBABLE CAUSE	WHAT TO DO
AM, FM or MPX reception.	A. Constant or intermittent noise heard at times or in certain area.	* Discharge or oscillation caused by electrical appliances, such as fluorescent lamp, TV set, D.C. motor rectifier or oscillator. * Natural phenomena, such as atmospheric, static or thunderbolts. * Insufficient antenna input due to ferroconcrete wall or long distance from station.	* Attach noise limiter to electrical appliance producing noise, or attach it to receiver's power source. * Install outdoor antenna and ground receiver to raise SN ratio. * Reverse power cord plug/receptacle connections. * If noise occurs at certain frequency, attach wave trap to input. * Keep receiver at proper distance from other electrical appliances.
AM reception.	A. Noise heard at particular time of day, in certain area or over part of dial. B. High-frequency noise.	* Peculiar to AM broadcasts. * Adjacent-channel interference or beat interference. * TV set too close to stereo system.	* Install antenna for maximum antenna efficiency. See CONNECTIONS in operating instructions booklet. * In some cases, noise can be eliminated by grounding receiver or reversing power cord plug/receptacle connections. * Such noise cannot be completely eliminated by receiver, but it is advisable to turn Treble control counterclockwise, or turn on High Filter. * Keep TV set at proper distance from stereo system.
FM reception.	A. Noisy. B. A series of pops. C. Tuning noise between stations.	* Poor noise limiter effect or too low SN ratio due to insufficient antenna input. Note: FM reception is affected considerably by transmission conditions of station, such as power and antenna efficiency. As a result, you may receive one station quite well while receiving another station poorly. * Ignition noise caused by starting of nearby automobile engine. * Results from nature of FM reception. * FM Muting Release switch depressed.	* Install antenna (supplied) for maximum signal strength. * If this does not prove effective, use exclusive FM outdoor antenna. If using TV antenna for both TV and FM with divider, make sure TV reception is not affected. * Excessively long lead-in wire of antenna may cause noise. * Install antenna and its lead-in wire at proper distance from street or increase antenna input as described before. * Release FM Muting Release switch. * Ditto.

PROGRAM	SYMPTOM	PROBABLE CAUSE	WHAT TO DO
FM-MPX reception.	A. Noise heard during FM-MPX reception but inaudible during FM mono reception.	* Weaker signal because service area of FM-MPX broadcast is only half that of FM mono broadcast.	* Orient antenna for maximum antenna input. * Switch on High Filter and/or turn Treble control counterclockwise.
	B. Channel separation deteriorates during reception.	* Excess heat.	* Circulation of room air is important to receiver. Be sure that receiver is well ventilated.
	C. Stereo indicator blinks on and off.	* Interference.	* Indicator is not faulty, adjust VR ₄₀₂ .
Record playing or tape playback.	A. Hum or howling.	* Turntable placed directly on speaker. * Wire other than shielded cable used. * Loose terminal contact. * Shielded cable too close to power cord, fluorescent lamp or other appliances. * Nearby amateur radio station or TV transmission antenna.	* Place cushion between turntable and speaker cabinet or place them away from each other. * Connecting shielded cables should be as short as possible. * Turn on Low Filter or turn Bass control counterclockwise. * Consult nearest Radio Regulatory Bureau.
	B. Surface noise.	* Worn or old record. * Worn phono stylus. * Phono stylus dusty. * Improper stylus pressure.	* Recondition playback head of tape deck or replace turntable stylus. * Turn Treble control counterclockwise * Turn High Filter on.

ALIGNMENT

OUTPUT BALANCE ALIGNMENT OF POWER AMPLIFIER

STEP	CONNECT/ADJUST	REMARKS
1.	Connect 8-ohm (or 16-ohm) resistor (minimum rating of 50 watts) to SYSTEM-A left-channel speaker terminal.	
2.	Connect voltmeter to same speaker terminal.	Use voltmeter with 0.1-1V range.
3.	Set Speaker Selector to SYSTEM-A position.	
4.	Adjust VR ₈₀₁ (left channel) so that voltage will be kept within $0 \pm 50\text{mV}$.	
5.	For right channel, repeat above procedure, but adjust VR ₈₀₁ (right channel) in step 4.	

CURRENT ALIGNMENT OF POWER AMPLIFIER

STEP	CONNECT/ADJUST	REMARKS
1.	Remove F ₈₀₁ and F ₈₀₂ .	Refer to "About the Quick-Acting Fuses" (page 13).
2.	Turn VR ₈₀₂ (left and right channels) fully counterclockwise.	
3.	Tun on receiver.	
4.	Connect ammeter (tester) where F ₈₀₁ was (refer to illustration below).	Be sure power is turned on before connecting ammeter. Set ammeter to its 30~100mA range.
5.	Turn VR ₈₀₂ (left channel) slowly clockwise until ammeter shows $15 \pm 3\text{mA}$.	
6.	Turn off power, then replace F ₈₀₁ .	
7.	Turn on power again.	
8.	Now, connect ammeter where F ₈₀₂ was (refer to illustration below).	
9.	Turn VR ₈₀₂ (right channel) slowly clockwise until ammeter shows $15 \pm 3\text{mA}$.	
10.	Turn off power, then replace F ₈₀₂ .	

ALIGNMENT

FM ALIGNMENT PROCEDURE

NOTE: Set FM signal generator level to minimum first.

Equipment required: 1. Sweep Generator 2. Oscilloscope 3. FM Signal Generatator 4. Multiplex Stereo Generator 5. AC V.T.V.M.

STEP	ALIGN	GENERATOR	FEED SIGNAL	OUTPUT INDICATOR	DIAL TO SET	ADJUST	ADJUST FOR
1	Discriminator.	Sweep generator 10.7MHz $\pm 200\text{kHz}$.	To TP ₁₀₁ via 10pF ceramic capacitor.	Oscilloscope connected to 2F.		FM Discriminator transformer T ₂₀₁ primary and secondary.	S curve.
2.	O.S.C.	FM signal generator 88MHz 400Hz 100% modulation.	To antenna terminals.	Oscilloscope and V.T.V.M. at output load.	88MHz.	O.S.C. coil L ₁₀₄ .	Maximum.
3.	O.S.C.	FM signal generator 108MHz 400Hz 100% modulation.	Same as above.	Same as above.	108MHz.	O.S.C. trimmer TC ₁₀₄ .	Maximum.
4	Repeat 2 and 3.						
5	RF Amp. Circuit.	FM signal generator 90MHz 400Hz 100% modulation.	Same as above.	Same as above.	90MHz.	Antenna coil L ₁₀₁ , L ₁₀₂ and L ₁₀₃ .	Maximum.
6.	RF Amp. Circuit.	FM signal generator 106MHz 400Hz 100% modulation.	Same as above.	Same as above.	106MHz.	Trimmer TC ₁₀₁ , TC ₁₀₂ and TC ₁₀₃ .	Maximum.
7	Repeat 5 and 6.						

FM MULTIPLEX ALIGNMENT PROCEDURE

Do not attempt to align Multiplex Circuit unless following equipment is available:

1. Multiplex Stereo Generator 2. Oscilloscope 3. AC V.T.V.M. 4. Low Frequency Oscillator 5. FM Signal Generator

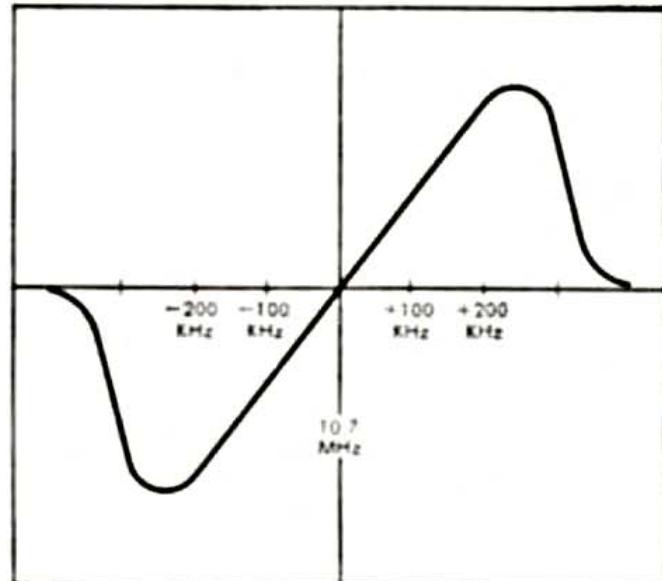

STEP	ALIGN	GENERATOR	FEED SIGNAL	OUTPUT INDICATOR	ADJUST	ADJUST FOR
1.	Separation VR.				VR ₄₀₁ .	Fully counter-clockwise.
2.	67kHz Coil.	Low frequency oscillator 67kHz.	4A.	V.T.V.M. and Oscilloscope at TP ₄₀₁ .	L ₄₀₄ .	Minimum.
3.	Stereo separation 19kHz Coil.	FM signal generator 98MHz 100% modulation Stereo signal generator —composite signal with pilot signal, left channel, 40% modulation.	Antenna terminals Tune to signal.	V.T.V.M. and oscilloscope at right channel output load.	L ₄₀₆ .	Channel-R minimum.
4.	Stereo separation VR.	Same as above.	Same as above.	Same as above.	VR ₄₀₁ .	Same as above.

AM ALIGNMENT PROCEDURE

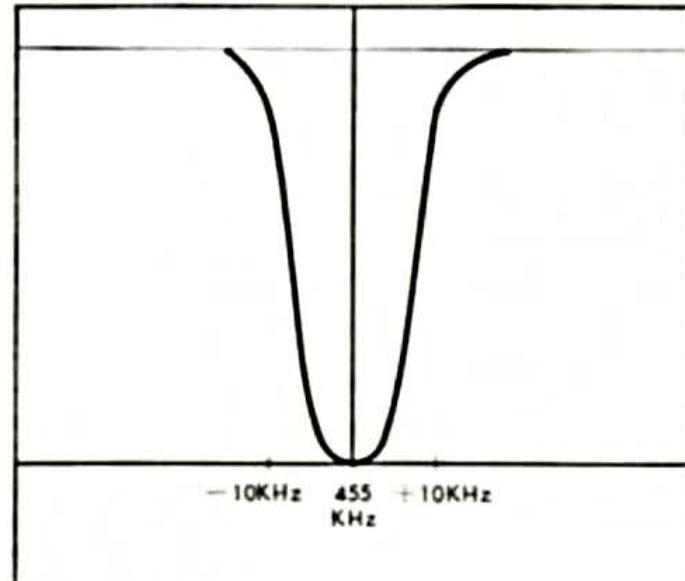

NOTE: To align, set AM signal generator level to minimum.

STEP	ALIGN	GENERATOR	FEED SIGNAL	OUTPUT INDICATOR	DIAL SETTING	ADJUST	ADJUST FOR
1.	IF Transformer.	455kHz \pm 30kHz Sweep-generator.	TP ₃₀₁ .	Oscilloscope and V.T.V.M. at 3G.		I.F.T. T ₃₀₂ , T ₃₀₄ and T ₃₀₅ .	Best IF wave form.
2.	O.S.C.	AM-generator 535kHz 400Hz 30% Modulation.	Antenna terminals	Oscilloscope and V.T.V.M. at output load.	535kHz.	O.S.C. coil T ₃₀₃ .	Maximum.
3.	O.S.C.	AM-generator 1600kHz 400Hz 30% Modulation.	Same as above.	Same as above.	1600kHz.	O.S.C. trimmer cap. TC ₃₀₃ .	Maximum.
4.	Repeat 2 and 3.						
5.	RF amp.	AM-generator 600kHz 400Hz 30% Modulation.	Same as above.	Same as above.	600kHz.	RF transformer T ₃₀₁ .	Maximum.
6.	Antenna circuit.	Same as above.	Same as above.	Same as above.	600kHz.	Ferrite bar antenna coil L ₃₀₄ .	Maximum.
7.	RF amp.	AM-generator 1400kHz 400Hz 30% Modulation.	Same as above.	Same as above.	1400kHz.	RF trimmer TC ₃₀₂ .	Maximum.
8.	Antenna circuit.	Same as above.	Same as above.	Same as above.	1400kHz.	Antenna circuit trimmer TC ₃₀₁ .	Maximum.
9.	Repeat 5, 6, 7, 8.
