

TA-1120

FOR THE SETS WITH SERIAL
NUMBER FROM 1001 TO 4000

Specifications (1)

System: All Silicon Transistor integrated stereo amplifier

Circuit: Quasi-complementary symmetry circuit, 46 transistors, 23 diodes

Transistor: 2SC401 (27), 2SC293 (3), 2SC297 (1), 2SC299 (5), 2SD45 (8), 2SA-527 (2)

Diode: DS2M (4), FR-1U (4), IT206 (10), SV6 (4), 2SF-103 (1, SCR)

Power requirement: 100, 117, 220 or 240V AC 50/60 Hz

Power consumption: Approx. 30W at zero signal

Approx. 200W at rated output

Dimensions: 400W×145H×310 mm D (15 $\frac{3}{4}$ ×5 $\frac{3}{4}$ ×12 $\frac{1}{4}$) (including knobs)

Weight: Approx. 11 kgs. (24 lbs.)

SONY®
SERVICING GUIDE

Specifications (2)

Amplifier section

Power output:	Non-clip music power: 160 W both channels (8 ohms) Music power (IHF) : 120 W both channels (8 ohms) ± 0.5 db Rated output (IHF) : 50 W per channel (8 ohms) ± 0.5 db 35 W per channel (16 ohms) ± 0.5 db
Harmonic distortion:	At 1 KHz: (IHF) Less than 0.1% at rated output Less than 0.07% at 25 W output Less than 0.05% at 0.5 W output
	At 20 Hz~80 KHz: Less than 0.5% at rated output
Intermodulation distortion:	Less than 0.3% at rated output, 70 Hz: 7 KHz=4:1 (SMPTE)
Frequency response:	10 Hz~100 KHz $+0_{-1}$ db at rated output
S/N ratio:	Closed circuit (IHF) 110 db *through weighted network as per ASA Z24.3-1944 (40 db-A)
Input impedance:	100 k ohms or more
Damping factor:	More than 70 at 1 KHz
Sensitivity:	1 V at 50 W output

Preamplifier section

Output voltage:	Preamp out: 1.5 V, Rec out: 0.2 V
Harmonic distortion:	At 1.5 V output: Less than 0.1% at 1 KHz Less than 0.1% at 30 Hz Less than 0.2% at 15 KHz
Frequency response:	Tuner input, Aux input (flat frequency response) 30 Hz~100 KHz $+0_{-2}$ db (twin-T low-cut filter below 30 Hz) Phono-1, Phono-2 (zero-reference frequency) 30 Hz~15,000 Hz ± 0.5 db (RIAA eq. curve) Tape head (zero-reference frequency) 30 Hz~15,000 Hz ± 0.5 db (NAB eq. curve) (adjustable ± 3 db at 10 KHz) Mic input (flat frequency response) 30 Hz~50,000 Hz $+0_{-2}$ db
Input sensitivity:	Tuner, Aux 0.2V (adjustable), Impedance: more than 100 k ohms Phono-1 5 mV, " " 47 k ohms Phono-2 1 mV, " " 47 k ohms Tape head 1 mV, " " 500 k ohms (suitable for 4.5 k ohm playback head) Mic 2 mV, " " 500 k ohms
Inputs:	Mic, Tape head, Phono-1, Phono-2, Tuner, Aux, Tape, Rower Amp in
Outputs:	Rec out (0.2V), Preamp out
Integrated record/playback connector:	Input sensitivity: 0.5 V Output level : 25 mV
Tone controls:	Bass 100 Hz ± 10 db 2 db/step Treble 10k Hz ± 10 db 2 db/step
Filters:	High filter 12 db/oct above 9 KHz Low filter 12 db/oct below 50 KHz
S/N ratio:	Aux, Tuner (closed circuit) more than 90 db (IHF) Phono-1 (") " 80 db Phono-2 (") " 70 db Tape head (") " 70 db Mic (") " 65 db *through weighted network as per ASA Z24.3-1944 (40 db-A)
AC outlets:	Switched.....2 Unswitched.....1

Warm-up Time for TA-1120

Integrated Stereo Amplifier TA-1120 which have been in stock or not used for a long time, it takes several minutes to start operation after Power Switch is set on for the first time. It is due to Electrolytic Capacitor in Muting Relay Circuit which serves to give proper time-lag (usually 6~7 seconds) to the Amplifier.

When Electrolytic Capacitor is left unused, leakage current value increases and it takes much more time than usual for Electrolytic Capacitor to charge up to normal voltage.

It gives no affect to the natural performance of Amplifier itself.

Upon the reports so far received and the result of investigation, attention should be paid to the following points.

1. It does not engender excessive time-lag to leave the unit unused for about one month.
2. It takes 2 or 3 minutes at longest to start operation, however only one set took 10 minutes in very rare case.

We hope you will take this phenomena in throughly especially when you set Power Switch on in customer's presence for the first time.

This Service Manual for TA-1120 is mainly written for channel 1 [Left Channel].
That same can be said about channel 2 [Right Channel].

Method of Disassembling the Set

(I) Removal of main amplifier and power supply block.

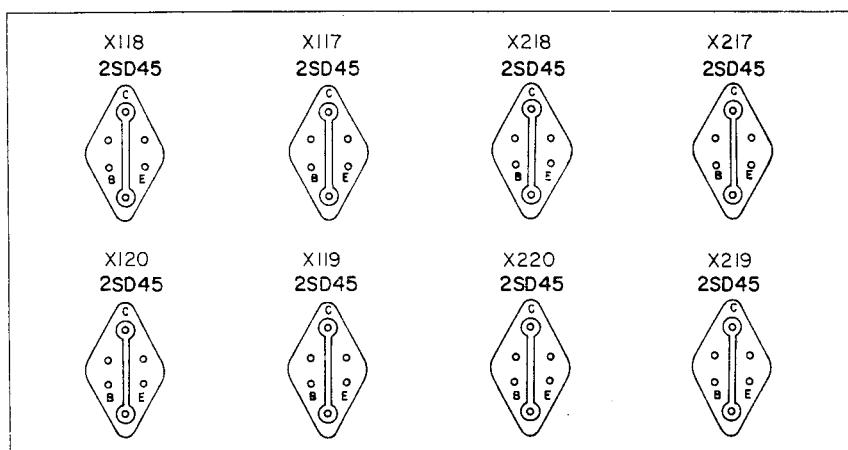

- (a) Remove four machine screws from both side of the chassis cover to take it off.
- (b) Remove five screws from bottom of chassis to release the back panel block as shown in Fig. 1.
- (c) Unsolder the mylar capacitor (C501) from main amplifier, then remove the two screws as shown in Fig.2. Now the muting circuit board can be removed.
- (d) Remove the five screws from main amplifier and power supply chassis as shown in Fig.3, so you can turn the block to make the circuit board up as shown in Fig.4.

(II) Removal of control panel block. (preamplifier block)

- (a) After take the chassis cover off, remove two screws from the bottom of chassis (Fig.1), and then remove four screws from side of the chassis as shown in Fig. 4, now you can separate control panel block from chassis.
- (b) The service will be easily done after removing control panel and preamplifier block respectively. (Fig. 5)

ADJUSTMENT

Preparation for adjustment

- * Voltage Selector Plug : Insert the Plug so that the top arrow mark of the plug points to the proper voltage figure.
- * DC Balance Control (R217, 417) : Turn clockwise to the full.
- * Compensation Diode : Check that the Diode is attached to heat sink.
- * Load for output : Connect an 8 ohms resistor instead of Speaker.
- * Fuse : Set a 5A Fuse.

(A) Balancer Adjustment.

1. Feed a 1KHz signals of -10dBs to the right and left Tuner input terminal.
2. Set Function selector switch (S2) to Tuner position.
3. Connect a V.T.V.M. across the output jack of preamplifier and the ground.
4. Adjust the Balance Control R174, 374 (10K ohms B) so that V.T.V.M. indicates the same output voltage both on left and on right channels.

(B) AC Balance Adjustment.

1. Connect an oscilloscope and V.T.V.M. across the 8 ohms load resistor.
2. Feed a 1KHz Signal to the input terminal through the attenuator and increase the signal gradually.
3. When the wave form on the oscilloscope is slightly clipped, adjust 50K ohms adjustable resistor (R214, 414) so that the both upper side and lower side of waveform are clipped at the same time.
4. Make the above procedures on both channels.

(C) Current Adjustment at Zero Signal.

1. Adjust the input signal to zero (less than -50dBs.)
2. Connect voltmeter (multitester) across the 0.5 ohms resistor (R223~226, R423 ~426).
3. Adjust the 200 ohms adjustable resistor (R217, 417) to obtain 25mV reading on the voltmeter.
4. Repeat the above (B) procedures adjustment.

(D) Circuit Breaker Adjustment.

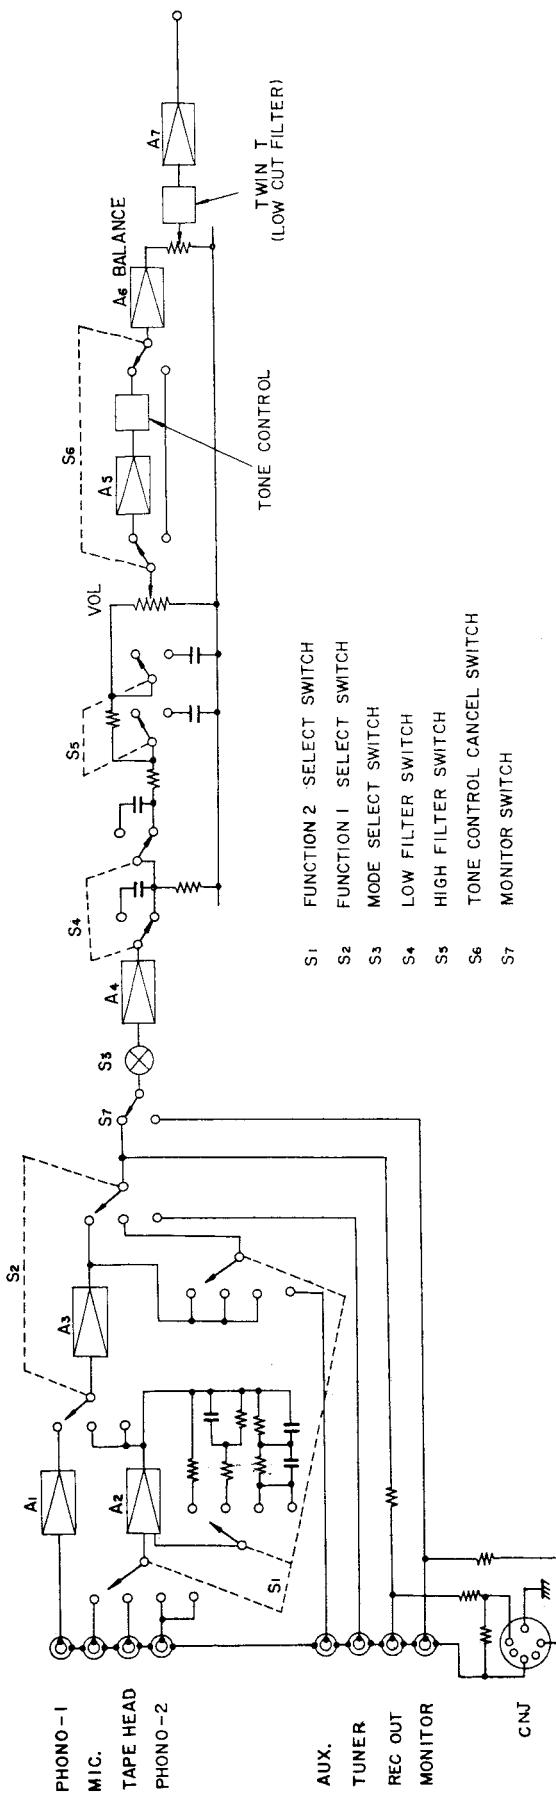

Make it a rule to adjust the circuit breaker block after repairing it, before connect it to amplifier.

1. Turn the 200 ohms adjustable resistor (R502) counter clockwise to the full.
2. Supply the constant voltage of DC 2V $\pm 0.02V$ to Trigger Input.
3. Supply 85V between B+ and E.
4. Connect the voltmeter across the B-out and E.
5. Turn the 200 ohms adjustable resistor (R502) clockwise, and fix it when the voltmeter indicates 0V on the dial.
6. Check that the circuit breaker works with the input from both D21, D25.

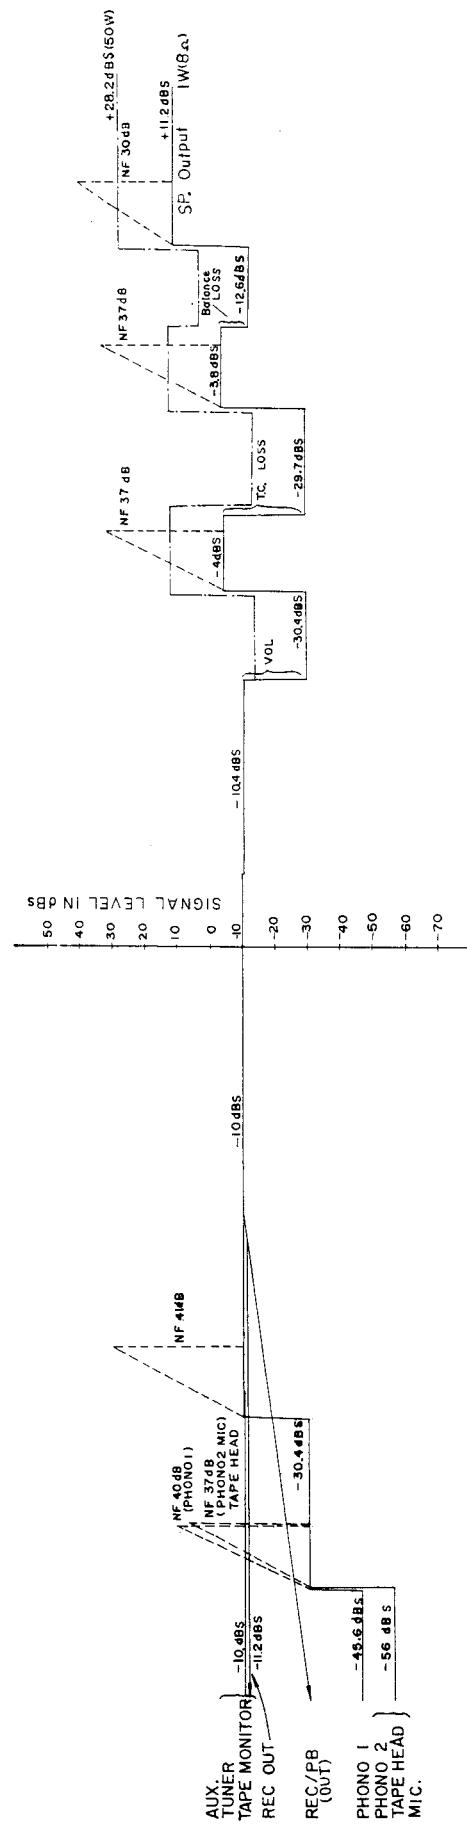

Other Items for Confirmation:

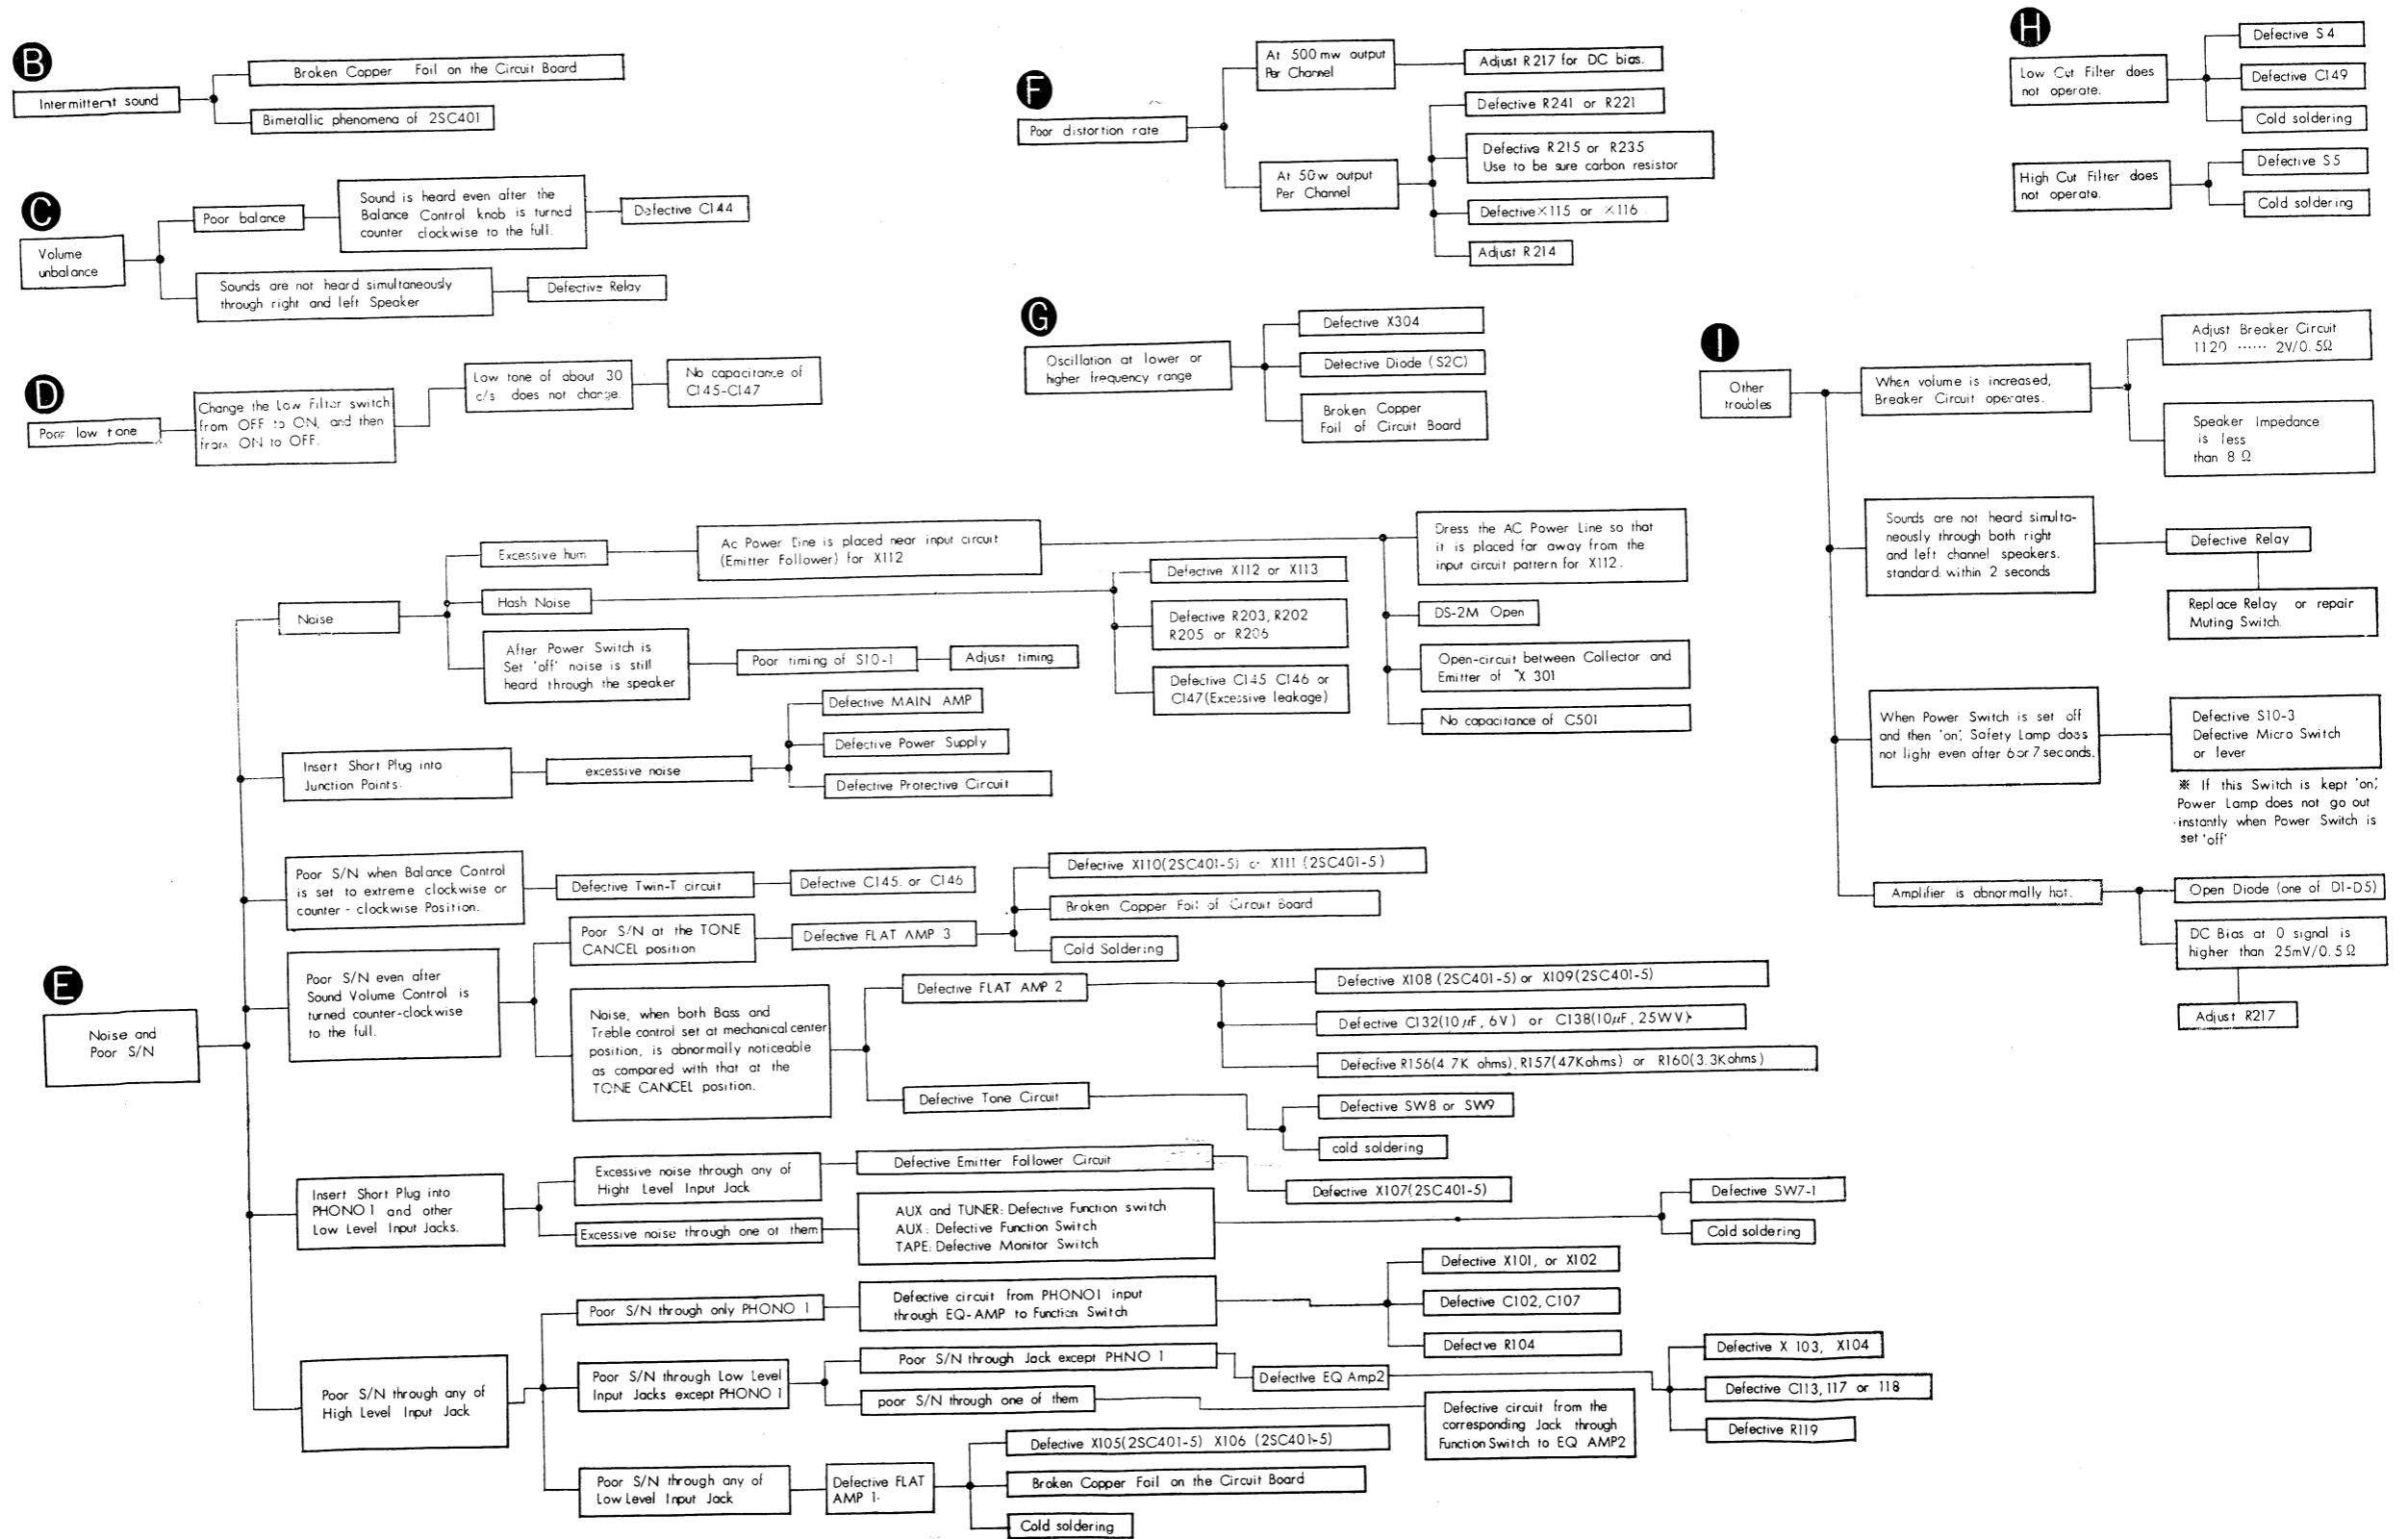

1. Relay works within 15sec. after Power Switch is set on for the first time, and it will be 4~10 sec. for the second time.
The difference of time between channel 1 and channel 2 is within 10 sec.
2. Phase of both channels must be same.
3. The difference of output level between channel 1 and channel 2 must be less than 2 dB., when the input level control knob set to maximum level position.
4. Output level must be decreased to zero by adjusting the input level control knob.
5. When short-circuit the speaker output, the circuit breaker must work perfectly.

TROUBLE SHOOTING for TA-1120

Poor Sound Volume

- NO Sound (Weak Sound)..... A
- Intermittent Sound..... B
- Volume unbalance..... C

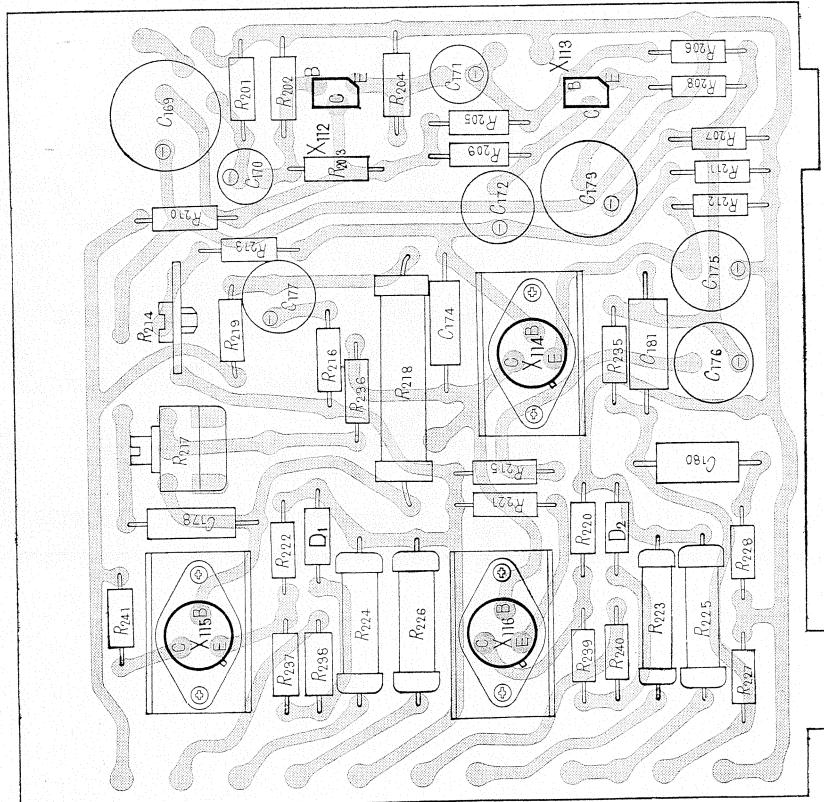

Poor Tone Quality

- Poor low tone..... D
- Noise & Poor S/N..... E
- Poor distortion rate..... F
- Oscillate at low or high frequency range..... G
- Low Cut filter does not operate..... H
- Other troubles..... I
