Dismantling the rear and top covers.

Dismantling the front and bottom covers.

Electrical adjustments

Test conditions

Approx. 30 minutes warming up time without signal applied. The top and bottom cover should not be removed, otherwise the unit must be covered.

Distortion, unloaded

Adjust R131 to minimum distortion, at 12 V output, 1 kHz, and no load. The distortion should be less than 0.004%.

D.c. offset adjustment

- Solder two LED's (light emitting diodes) with opposite polarity together in parallel and connect them to the contact J106 on the power amplifier board (collector on Q102).
- Adjust R115 until the LED's are switched off.
- Remove the LED's and measure the d.c. voltage on the output terminals. The d.c. voltage should be less than ± 35 mV.

Quiescent current

The quiescent current should be adjusted without load and no signal applied at the input terminals.

- Adjust R164 on the output amplifier board to 35 mV across R505 and R605 on the power supply board.

Distortion, loaded

Apply a signal of 1 kHz and drive the amplifier to 12 V on the output terminals when the load is 4 ohm.

- Adjust R131 to minimum distortion. The distortion should be less than 0.005%.

Checking the speaker protection relay

- Disconnect speaker load.
- Apply 6 to 8 V d.c. with 220 kohm in series (+ and – alternately) to R508/R509. The relay should then open.

NOTE!

Input FET's Q103 and Q104 are matched pair, and should be replaced with the same group. Each matched pair of transistors needs a specific value of source resistors (written by hand on the pc board). After replacing the FET's, check for correct current.

The voltage across R147 should be $2.2 \text{ V} \pm 0.2 \text{ V}$.

All measurements in the amplifier must be made with a probe having minimum 5 kohms.

Peak clipping

Adjust R137 to minimum light in LED at slight dipping.

ADJUSTMENTS

- Adj "Distortion unloaded" R131/231 to min. distortion, 12V output, 1kHz, no load.
0,004% max. distortion
The voltage across R150/250 should be 2,65V $\pm$ 0,45V
All measurements must be made with a probe having minimum 5kohms resistors in both terminals
- Connect two LED's in antiparallel to J206. Adj "Zero DC" R115/215 until both diodes turn off DC at speaker output should be within $\pm$ 50mV DC
- Adj. "Distortion loaded" R153/253 to min, distortion at 12V across 4...1kHz, 0,005% max.
- Adj. "Quiescent current" R164/264 to 30mV across R505/605.
- Adj. "Peak clipping" R137/237 to min light in LED at slight clipping.

Check the adjustments after 15 min warm-up time.

- Components with this marking has 1% tolerance.

When Q103/104/203/204 have to be replaced, the following must be done. Use the table below to find the combination of the transistors' Idss groups and source resistors. Resistors marked * is dependent on Idss of the field-effect transistors

	2N5458 (2N5459), 2N5461	2N5462
Idss(mA)	R124	R127
4-5	82 Ω	220 Ω
5-6	120 Ω	220 Ω
6-7	180 Ω	470 Ω
7-8	270 Ω	680 Ω
8-9	330 Ω	1k
9-10	390 Ω	1k2
10-11	470 Ω	1k

How to measure Idss

$$Idss(mA) = \frac{U(volt)}{0,1(Kohm)}$$

Both FET's must be within the same Idss-group
