# 1 GENERAL DESCRIPTION

The TEAC A-4070G is a 2 channel, 4 track tape deck capable of both bi-directional recording and playback, The A-4070G employs a three motor mechanism, solenoid operated, with auto reverse in either direction, automatic repeat and continuous play capability.

The basic design of the A-4070 is highly similar to that of the A-4070G, therefore information in this service manual may be applied to the A-4070.

This service manual provides adjustment and alignment procedures, schematic diagrams and parts replacement information and the proper procedures for obtaining necessary repair parts.

If adjustments or repair procedures are not clear or seem difficult to accomplish or should you desire more detailed technical information, please contact your nearest TEAC dealer, TEAC Corporation or affiliated corporations, address's of which are printed in this manual.

## 2 SERVICE DATA

### MECHANICAL

---

Heads: Four track 2 channel stereophonic  
(Ferrite) Erase/Record combination head ×2;  
Erase section,  
1.8kΩ/100kHz, erase current approx. 30mA  
Record section,  
95Ω/1kHz, bias current approx. 25mA  
4.7kΩ/100kHz, signal current approx. 400Hz 200μA  
Playback ×2;  
1~2kΩ/1kHz -66dB

Tape Width: Standard 1/4 inch tape

Tape Speed: 7-1/2ips and 3-3/4ips (±0.5%)

Motors: 4/8-pole dual speed hysteresis synchronous  
motor for capstan drive  
Two 6-pole eddy current motors for reel drive

Wow and Flutter: 0.06% at 7-1/2ips  
0.09% at 3-3/4ips  
Wow and flutter measured according to weighted  
NAB standard using TEAC test tape.

Fast Winding Time: Approx. 120 seconds or less for 1200 feet

Operating Position: Horizontal or vertical

Power Requirements: 100/117/200/220/240V AC 50/60Hz 125W

Weight: 51 lbs (23kg) net

### ELECTRICAL

---

Transistors: 2SC733BL ×2      2SA494 ×2  
2SC733 ×14      2SC971 ×2  
2SC1000BL ×12

Diodes: FR2-02 ×3      FR2-10 ×2  
SIB02-B ×1      FR2-08 ×3  
FR2-06 ×7

Frequency Response: Overall from recording INPUT to playback  
OUTPUT using SCOTCH #203 tape  
7-1/2ips, ±3dB 30Hz~20kHz  
3-3/4ips, ±3dB 40Hz~10kHz

Equalization: NAB equalization  
7-1/2ips 50μ sec      3-3/4ips 90μ sec

Input: MIC 0.3mV (-70dB)  
LINE 0.1V (-18dB)

Bias Frequency: 100kHz push-pull oscillator

Signal to Noise Ratio: 7-1/2ips 48dB or higher  
3-3/4ips 46dB or higher  
at playback to unweighted noise

Stereo Chan. Separation: 45dB channel to channel at 1kHz

Cross Talk: 35dB adjacent track at 100Hz

Erase Efficiency: 70dB or more at 7-1/2ips

These specifications are indispensable information and are required to service the equipment properly. They may differ slightly from those printed in the advertising brochures or the operation manual.

### 3 EQUIPMENT REQUIRED

#### FOR MECHANICAL MEASUREMENT

SPRING SCALE:	0~4 kilo-grams (0~8 lbs) #5086025000
	0~300 grams (0~10 oz) #5086026000
TEST TAPE:	TEAC YTT-2003 (7-1/2ips)
	TEAC YTT-2002 (3-3/4ips)
FLUTTER METER:	Meguro Model MK665B (preferred) or Sentinel FL-3D-1
DIGITAL FREQ. COUNTER:	Capable of 0 to 5kHz indication
TOOLS:	General, 2mm nut driver #5086014000 Hex head, allen wrench #5086021000

Fig. 3-1 Spring Scale, and TEAC Test Tape

#### FOR ELECTRICAL MEASUREMENT

TEST TAPE:	TEAC YTT-1003 for 7-1/2ips
	TEAC YTT-1002 for 3-3/4ips
	SCOTCH 203 and 150 for test recording
EMPTY REEL:	TEAC RE-702 (2" hub)
	TEAC RE-701 (4" hub)
TEST SET:	TEAC M-826A test set
BAND PASS FILTER:	TEAC M-206A (1kHz)
AC/DC VTVM:	General purpose
RESISTOR:	Non inductive type 8Ω/1W
OSCILLOSCOPE:	General purpose

Fig. 3-2 TEAC M-826A

#### NOTE

Use of the TEAC M-826A test set is recommended. This set incorporates an AC VTVM, Audio Oscillator, Channel Selecting switch, Variable Attenuator, Monitor Speaker and Cables.

TEAC M-826A measures the RMS value of the Voltage (0dB=0.775V). Characteristics of this test set are similar to the standard VU-meter.

## 4 PARTIAL DISASSEMBLY

### REMOVING THE EQUIPMENT FROM CASE

Case should only be removed to perform major maintenance.

1. Lay tape deck, face down on a soft mat.
2. Remove the two (2) screws at the top of the case, remove the four (4) screws on rear of case. Carefully lift case from mechanism.

D-0021

Dimensions

## FRONT PANEL REMOVAL

---

1. Place the A-4070G on its back, with the front panel assy face up and the bottom of the deck towards you.
2. Remove the head housing assy.
3. Remove both tape tension arms.
4. Remove knobs.
5. Remove the ten (10) cross-point screws from the front panels.

### NOTE

Two screws are immediately above the tape head mechanism.

6. Lift off the control panel assy.
7. Lift off the front panel assy.

## AMPLIFIER ASSEMBLY ACCESS

---

The A-4070G is equipped with a removable amplifier assembly. By removing the six screws that secure the amplifier to the bottom of the chassis, you can easily swing out the amplifier for maintenance. Most of the replacement components are completely accessible. If amplifier assy maintenance is necessary, follow these steps:

1. Complete all steps in front panel removal.
2. Remove six (6) cross-point screws from the sides of the bottom panel.

### NOTE

Three lower screws are holding the cover panel over the PC boards. These need not be removed. Access slots are provided.

3. Grasp the control shafts and gently swing the amplifier assy down towards you. Two screws on the lower sides act as a hinge for the assy.
4. To re-assemble, reverse the above procedure.

### CAUTION

When closing the amplifier assy, closely observe the wires leading to the right-channel VU meter lamp socket.

## AMPLIFIER ASSEMBLY ACCESS

## PLAYBACK HEAD REPLACEMENT

---

The playback heads have a detachable shielded housing, see the exploded view illustration for disassembly instructions.

Fig. 4-1 Individual Heads

## CAPSTAN MOTOR REMOVAL

---

1. With front panel removed, remove 4 capstan motor mounting screws.
2. Unsolder the 6 wires connecting the capstan motor. (Carefully note the wire locations and color codes).

### NOTE

After motor replacement, check position of capstan pulley on shaft for proper alignment with belt guide.

Fig. 4-2 Capstan Motor Removal

## REEL MOTOR REMOVAL

---

1. Disconnect oiling tubes at motor housing.
2. Loosen 2 set screws securing the reel table assembly, remove reel table.
3. Remove the four screws securing motor to chassis, unsolder the six wires connecting the motor.

### NOTE

Reel motor assemblies are mirror images of each other, these assemblies are not interchangeable.

Fig. 4-3 Reel Motor Removal

## DISASSEMBLY OF CAPSTAN/HEAD MOUNT AREA

---

1. Remove the VU meter holder.
2. Remove four button head Philips screws securing the head base plate.

Base plate may now be lifted forward to accomplish belt replacement. In order to replace the capstan assembly, the slide base assembly must first be removed.

1. Remove the L & R lower head protectors. Remove pinch roller.
2. Remove lower screw and nylon inserts from slide base assembly. (located below the pinch roller shaft housing).
3. Disconnect slide base assembly coil spring.
4. Remove the screw in one of the head PC board brackets, lift PC board from bracket thus freeing the lifter spring bracket.
5. Remove screw and nylon inserts from lifter spring bracket.
6. Slide base assembly may now be removed exposing the capstan assembly mounting screws.

Fig. 4-4 Capstan Assy and Head Mount Removal

## 5 HEAD ALIGNMENT -MECHANICAL-

### NOTE

Head alignment is adjusted at the factory to very critical tolerances. Normally HEAD ASSEMBLY replacement will require only minor alignments or adjustments. Complete readjustment should only be necessary after an individual head is replaced. The adjustments are made as follows:

### FORWARD SIDE

- ERASE/RECORD COMBINATION HEAD: The record head pole should be above the edge of a threaded tape by the width of thin pencil line.  
NOTE: Erase head should be heavy pencil line.
- PLAYBACK HEAD: The playback head pole should be even with the top of a threaded tape.

Fig. 5-1 Head Alignment and Adjustment Screws

M-0287

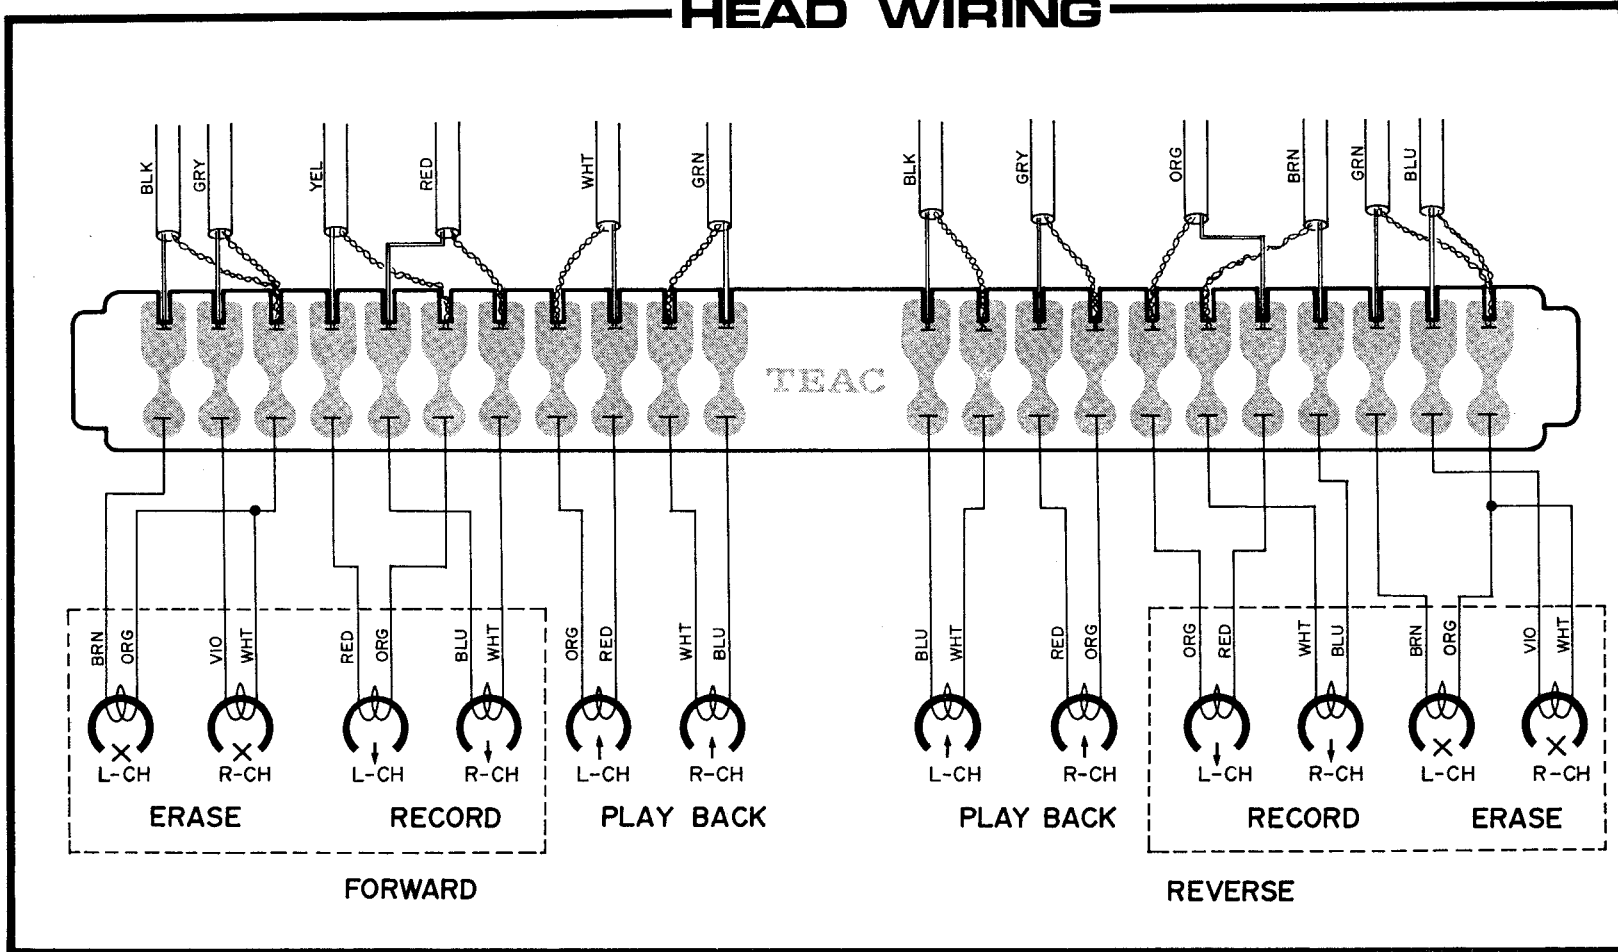

### REVERSE SIDE

- ERASE/RECORD COMBINATION HEAD: The record head pole should be bottom the edge of a threaded tape by the width of thin pencil line.  
NOTE: Erase head should be heavy pencil line.
- PLAYBACK HEAD: The pole of the playback head should be even with the bottom of a threaded tape.

### NOTE

Azimuth adjustments are given in the section on MEASUREMENT AND ADJUSTMENT -ELECTRICAL-

# HEAD WIRING

NOTE: [ ] Combination Head  
 The position of the wires on the  
 circuit board. Connect the new  
 head in the same manner.

M-0292

## 6 MEASUREMENT AND ADJUSTMENT -MECHANICAL-

### PINCH ROLLER PRESSURE ADJUSTMENT PROCEDURES

#### NOTE

Pinch roller pressure is supplied by pinch roller spring arm only and it is most important that the solenoid plunger be fully bottomed before pressure measurement. Remove knob and amplifier panel.

1. Block the shut-off arms in the on position.
2. Attach a suitable spring scale to the pinch roller shaft.
3. Place the unit in the PLAY mode, and holding the spring scale as illustrated, slowly draw it away from the pinch roller.
4. Do not allow the string so rub against the pinch roller.
5. Note the reading on the spring scale at the instant the pinch roller stops rotating.
6. The scale should indicate  $2.0 \pm 0.2$  kg (5.0 lbs~5.6 lbs).
7. If adjustment is necessary, loosen the three screws on the capstan solenoid and position the solenoid for optimum pressure.
8. Solenoid spring width should be approx. 11 mm.

Fig. 6-1 Pressure Measurement and Adjustment Location

## REEL TORQUE ADJUSTMENT PROCEDURES

### Voltage Specifications

Before making reel torque adjustments, measure the voltages as outlined below. Voltages are measured from point (A) on PC board #50482780 and the applicable resistor tap. Place the unit in the PLAY mode.

- A. R-801, TAKE-UP TORQUE. Voltage from point (A) to center tap of R-801 should read  $54 \pm 1V$  AC.
- B. R-802, BACK TENSION. Voltage from point (A) to lower tap of R-802 should read  $45 \pm 1V$  AC. (Tape switch in REGULAR position.)
- C. R-803, TAPE TENSION (0.5 mil THIN position). Voltage from point (A) to R-802 lower tap should read  $40 \pm 1V$  AC with tape tension switch at THIN position.

Fig. 6-2 Tension Resistor Voltage Measurements and Operation Diagram

## TAKE-UP TORQUE MECHANICAL CHECK

---

1. Block the shut-off arms in the ON position.
2. Place tape tension switch in REGULAR position.
3. Place an empty reel (RE-701) on right reel table.
4. Rotate the reel and wind several turns of string around the hub.  
Attach the spring scale to the string, depress the ► button.
5. Allow the rotation of the reel to slowly draw the scale toward the hub. The spring scale should indicate  $300 \pm 20$  g-cm ( $4.2 \sim 4.6$  oz-inch).
6. Adjust R-801 as required.

## BACK TENSION MECHANICAL CHECK

---

7. Place the reel and spring scale on the left reel table, depress the ► button.
8. Pull the scale away from the reel against the motor torque with a smooth steady motion.
9. The scale should indicate  $230 \pm 20$  g-cm ( $3.2 \sim 3.6$  oz-inch).
10. Adjust R-802 as required.

### NOTE

Torque and back tension measurements may be made in either direction (forward, reverse) of play.

Fig. 6-3 Torque Measurement Forward and Reverse Side

## BRAKE TORQUE ADJUSTMENT PROCEDURES

### NOTE

The brake torque is actuated mechanically. Pressure is set by the variable spring force. While making this measurement and adjustment, be careful not to bend the brake bands. As brake torque will change with cleaning, brake drums and brake shoes should be cleaned only when absolutely necessary. If cleaning is required, use TEAC cleaner TZ-251B only. After cleaning operate the machine for some time before performing the below procedures.

Brake torque adjustments are made with no power applied to the unit.

1. Place an empty 4" hub reel on the left reel table, and fasten one end of a 30" length of string to the reel anchor.
2. Wind several turns of string counterclockwise around the hub and attach a suitable spring scale to the free end of the string.
3. Pull the spring scale away from the reel, making sure that the string does not rub the reel flanges.
4. Take a reading only when the reel is in steady motion since the force required to overcome static friction will produce a false, excessively high initial reading.
5. The reading should be  $1300 \pm 100$  g-cm (16~20 oz-inch).
6. If adjustment is required, loosen the screw in the spring mount and position the brake for optimum torque.
7. The adjustment of the right brake is the same, with the exception that rotations are clockwise.

Fig. 6-4 Torque Measurement and Adjustment Location

### IMPORTANT

The difference in torque between the right and left brake should be kept within 50g-cm(0.7oz-inch).

#### LEFT RIGHT BRAKE TIMING

---

1. Block tension arms in ON position.
2. Depress ◀ or ▶ button, depress STOP key, observe that both reel turntables stop at exactly the same instant. If they do not, adjust the appropriate brake band spring mount as required. (Refer to Fig. 6-4 Adjustment Location.)

#### BRAKE BAND CLEARANCE

---

1. With power off, manually depress the brake solenoid plunger, brake band to drum clearance should be 1~2mm. Adjust to proper clearance by repositioning the brake band mount. (Refer to Fig. 6-4.)

#### REEL HEIGHT ADJUSTMENT

---

Reel height adjustment may be required to fit reels of different manufactures. Adjustment is accomplished by FINE ADJ. screw in the reel turntable. Reel turntable height should be adjusted using standard 7" reels. With a tape threaded on the machine, position the reel height for smooth tape travel.

Fig. 6-5 Reel Height Adjustment

## FLUTTER

---

Flutter should be measured in playback mode using a TEAC flutter free tape YTT-2003·2002 and Meguro model MK665B flutter meter. Measurement of flutter should be made in accordance with NAB standards.

Values obtained with different standards or equipment cannot be compared.

Flutter should not exceed. 7-1/2ips: 0.15%  
3-3/4ips: 0.20%

These figures apply to any tape position and direction (such as full take-up reel, full supply reel or about mid point).

## TAPE SPEED

---

The tape speed should be measured using TEAC flutter free tape, model YTT-2003·2002. These tapes contain a highly accurate 3 kHz tone. Connect a digital frequency counter to either line OUTPUT jack. The indicated frequency should be 3 kHz  $\pm$ 0.5% for all speeds.

Fig. 6-6 Test Equipment Set-Up

## VOLTAGE AND FREQUENCY CONVERSION

---

### Voltage Conversion

The A-4070G may be set for 100, 117, 200, 220 and 240V AC, to change the voltage unscrew the fuse in the center of the voltage selector plug, pull out the plug and reinsert it so that the desired voltage shows in the cutout, reinstall fuse.

Fig. 6-7 Voltage and Frequency Conversion

### Frequency Conversion

Frequency change is accomplished by means of the frequency change knob on rear of unit

1. Thread a tape on machine.
2. Start deck in playback mode.
3. While deck is operating, gently pull out on knob for 60 Hz operation, push in for 50 Hz operation.

# 7 MEASUREMENT AND ADJUSTMENT

## - ELECTRICAL -

### GENERAL NOTICE

Before performing maintenance on this unit, thoroughly clean and demagnetize the entire tape path.

It is important that the unit be set to the proper voltage and frequency for your locality.

TEAC specified standard test tapes and test equipment must be used when performing maintenance to insure reliable results.

Procedures for checks and adjustments, unless otherwise indicated, are for the left channel at a tape speed of 7-1/2ips. The same procedures are to be applied to the right channel and again for both channels at 3-3/4ips, and both directions.

All controls mentioned in this book will be printed in bold letters and will be exactly as they appear on the unit.

Double designated symbol numbers refer to left channel/right channel.

T H D : Third Harmonic Distortion.

## PLAYBACK PERFORMANCE

### PLAYBACK HEAD AZIMUTH ADJUSTMENT

#### Coarse Adjustment

1. Connect a level meter to either OUTPUT jack.
2. Thread a TEAC test tape YTT-1003 on the unit.
3. Play the 15 kHz test tone in section 2 of the test tape.
4. Slowly rotate the azimuth screw until maximum indication is obtained on the level meter. Repeat step 4, procedure for reverse head.

#### Fine Adjustment

#### CAUTION

After coarse adjustment, do not make large corrections, turn azimuth screw 1/4 turn or less.

5. It is absolutely essential to accomplish the coarse adjustment before using this method to avoid phase errors larger than 45°.
6. Connect the test equipment as shown in Fig. 7-8.
7. Play a 10 kHz signal and adjust the azimuth screw until the oscilloscope shows that the signals are less than 45° in phase. Repeat above step for reverse head.
8. Secure the screw with a drop of LOCTITE.

- ALIGNMENT - The physical positioning of a tape head relative to the tape itself. Alignment in all respects must conform to rigid requirements in order for a unit to function properly.
- AZIMUTH - The angle of a tape heads pole-piece slot relative to the direction of tape travel. Refer to Fig. 5-1 HEAD ALIGNMENT.

#### NOTE

In order for a tape unit to work at its best, with its own tapes as well as ones made on other units, its play and record heads must be aligned in the four ways shown above.

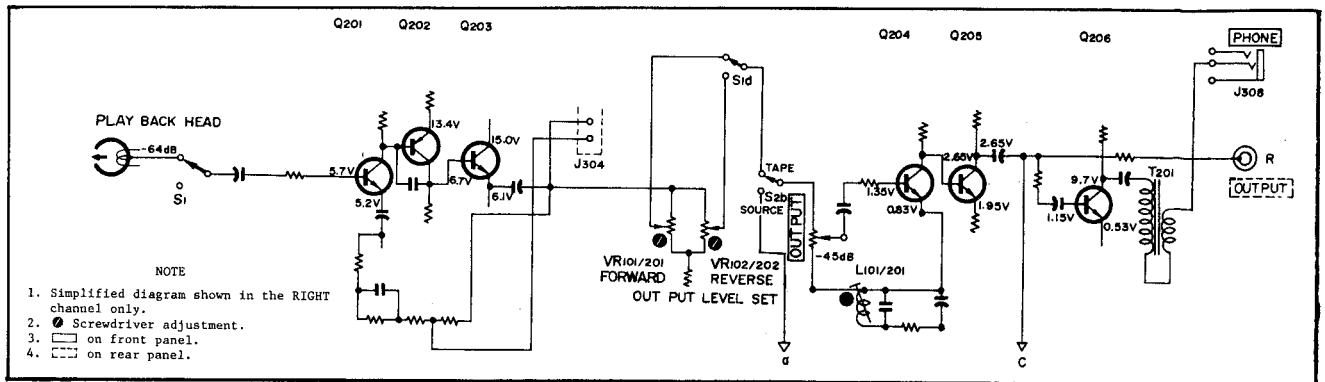

Fig. 7-2 Simplified Diagram -Playback-

SPECIFIED OUTPUT LEVEL SET

NOTE

Connect a 10 kΩ load to the OUTPUT jacks when not using the TEAC M-826A (0 dB = 0.775V) output meter.

1. Place the MONITOR switch in TAPE position.
2. Turn the OUTPUT controls fully clockwise.
3. Apply a 400 Hz signal at operating reference level (1% of the THD level).
4. Adjust FORWARD VR-101, VR-201, REVERSE VR-102, VR-202 to obtain a specified output level of -2 dB at OUTPUT jacks.
5. Retard OUTPUT controls to obtain a level of approximately -8 dB at OUTPUT jacks.

IMPORTANT

This is the specified output level set. Do not disturb this setting until the remaining adjustments have been completed.

M-0281

PB METER LEVEL SET

1. While playing the 400 Hz tone (1% THD) in section 1 of the test tape.
2. With MONITOR switch at TAPE position, adjust VR-106, VR-206 for a reading of 0 VU on the VU meter.

## FREQUENCY RESPONSE

1. Place TEAC test tape YTT-1003 (using 7-1/2ips), YTT-1002 (Using 3-3/4ips) on the unit.
2. Compare the readings obtained on the level meter with the response limits given in Fig.7-3
3. Forward and reverse playback frequency response should be identical.

Fig. 7-3 Frequency Response -playback-

## HEADPHONE OUTPUT CHECK

1. Place OUTPUT controls at specified level setting (400 Hz signal at -8 dB).
2. Connect an  $8\Omega$  non inductive resistor across the headphone output, connect level meter across the resistor.
3. Level meter should indicate  $-24 \text{ dBm} \pm 2 \text{ dB}$ .

Fig. 7-4 Headphone Connecting Resistor

## MONITOR PERFORMANCE

### SPECIFIED INPUT LEVEL SET

---

#### LINE Input

1. Connect an AF oscillator to the LINE IN jack.
2. Place MONITOR switch in SOURCE position.
3. Apply a 400 Hz signal -8 dB at LINE IN jack.
4. Turn LINE controls fully clockwise, then adjust LINE controls to obtain a specified output level of -8 dB at OUTPUT jack.

#### MIC Input

5. After adjusting LINE controls, apply a 400 Hz signal at -60 dB to the MIC IN jacks.
6. Rotate the Mic controls fully clockwise.
7. The output should be -8 dB (specified output level).

### REC METER LEVEL SET

---

Place OUTPUT controls at specified output level.

1. With MONITOR switch in SOURCE position.
2. Apply a 400 Hz signal at -8 dB to LINE IN jacks.
3. Adjust VR-107, VR-207 for OVU  $\pm 0.5$  dB on the VU meter.

## RECORD PERFORMANCE

Before making any adjustments on the record amplifier, be sure that all tests in the HEAD ALIGNMENT, PLAYBACK and MONITOR PERFORMANCE sections have been accomplished and that all adjustments are correct.

Optimum recording performance (bias levels, recording levels and frequency response) is dependent upon tape characteristics. The TEAC A-4070G is factory set for Scotch type 203 or 150 tape. Service data is based upon the use of Scotch 203 or equivalent tape

Fig. 7-5 Simplified Diagram -Record-

### BIAS TRAP ADJUSTMENT

#### NOTE

The bias trap tank circuit keeps the bias signal from reaching the record and monitor amplifier and under normal no signal conditions, voltage should not be present at the OUTPUT jack.

1. Thread a blank tape or block tension arms in on position.
2. Place the RECORD BIAS switch to HIGH position.
3. Connect a VTVM or oscilloscope to junction of C-146/L-102, C-246/L-202.
4. Adjust L-102, L-202 for a minimum reading.
5. Adjust L-101, L-201 for a minimum reading at OUTPUT jacks.

Fig. 7-6 Bias Trap Check Point and Bias Leakage

## BIAS ADJUSTMENT

### NOTE

Perform bias trap adjustment before proceeding. These adjustments are only made at 7-1/2ips tape speed. The bias oscillator frequency is  $100 \pm 10$  kHz.

### HIGH position

1. Thread record test tape SCOTCH 203 on the unit.
2. Place the RECORD MODE, EQ and BIAS switch to HIGH and the unit in the record mode.
3. Place the OUTPUT switch in the TAPE position.
4. Apply a 400 Hz signal at -8 dB to the LINE IN jack.
5. Adjust capacitor FORWARD VC-101, VC-201, REVERSE VC-103, VC-203 for a peak on the level meter.
6. Turn the capacitors clockwise until a decrease of 0.5 dB is obtained.

### NORMAL position

7. Thread record test tape SCOTCH 150 on the unit.
8. Place the RECORD MODE, EQ and BIAS switch to NORMAL position.
9. Adjust capacitor FORWARD VC-102, VC-202, REVERSE VC-104, VC-204 as in HIGH position.

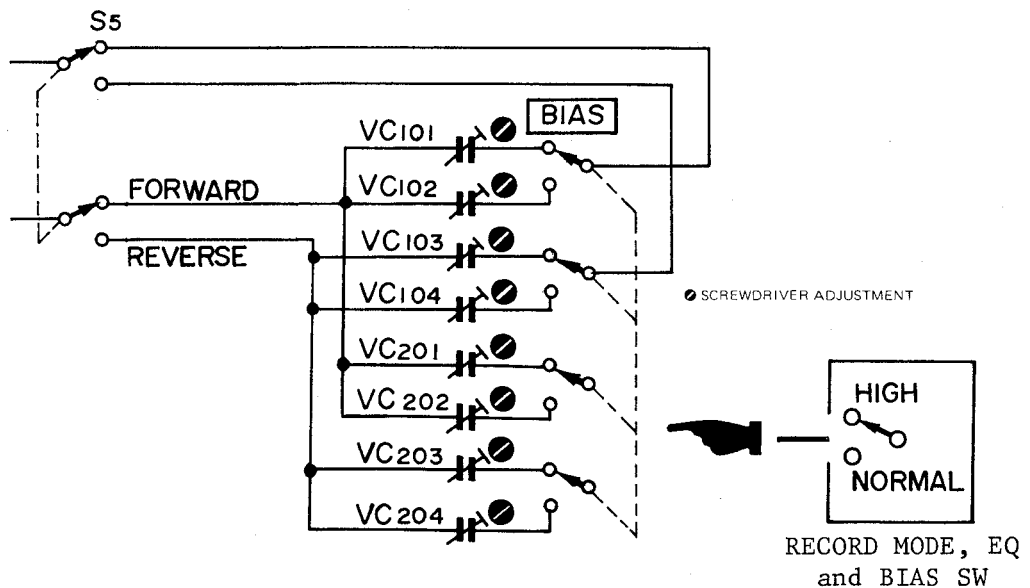

Fig. 7-7 Bias Adjustment Locations  
-Diagram-

## RECORD HEAD AZIMUTH ADJUSTMENT

---

### Coarse Adjustment

#### NOTE

The effect of turning the azimuth screw will not immediately register on the level meter. A slight delay will be noticed. Therefore, the screw must be rotated slightly, and then pause to see the effect. Refer to HEAD ALIGNMENT FOUR WAYS in the PLAYBACK HEAD AZIMUTH ADJUSTMENT.

1. Connect a Level Meter to the LINE OUT jacks and an AF oscillator to the LINE IN jacks.
2. Place the MONITOR switch to SOURCE and adjust the AF oscillator to obtain a signal of 15 dB below the specified output level. (The level meter will indicate -23 dB.)
3. Make certain that the LINE control is at the specified input level position, then set the AF oscillator to 10 kHz.
4. Thread a record test tape on the unit and place the mode L·R switches up.
5. Place the MONITOR switch in the TAPE position.
6. Adjust the azimuth screw for maximum indication of the level meter.

### Fine Adjustment

#### NOTE

It is absolutely essential to accomplish the coarse adjustment before using this method, to avoid phase error larger than 45°.

7. Connect the test equipment as shown in Fig. 7-8.
8. Apply a 7.5 kHz signal at -23 dB to the LINE IN jacks and record this signal.
9. Carefully adjust the azimuth screw until the oscilloscope shows the signal to be in phase.
10. Secure the screw with a drop of LOCTITE.

Fig. 7-8 Fine Adjustment Set-up -Head Azimuth-

## RECORD LEVEL SET

The OUTPUT controls must be at the specified output level position (-8 dB at output jack).

HIGH position.

1. Apply a 400 Hz signal at -8 dB to the LINE IN jack.
2. Thread a record test tape SCOTCH 203 on the unit. Set the RECORD MODE, EQ and BIAS switches to HIGH position.
3. Place the unit in the stereo record mode with the MONITOR switch in the TAPE position, LINE controls fully clockwise.
4. Adjust FORWARD VR-103, VR-203, REVERSE VR-104, VR-204 for -8 dB signal at OUTPUT jacks.

NORMAL position

5. Apply a 400 Hz signal at -8 dB to the LINE IN jack.
6. Thread a record test tape SCOTCH 150 on the unit. Set the RECORD MODE, EQ and BIAS switches to NORMAL position.
7. Adjust VR-108, VR-208 as in HIGH position. Do not adjust in reverse mode forward only.

## OVERALL FREQUENCY RESPONSE

HIGH position

1. Thread a blank SCOTCH 203 tape on unit, place RECORD MODE, EQ and BIAS switches at HIGH, tape SPEED at 7-1/2 19cm  $\square$  position.
2. Apply a signal swept from 20Hz~20kHz at -33 dB to LINE IN jack and record it on the test tape.
3. Adjust L-103, L-203 for best response.
4. Repeat above procedures for 3-3/4ips using a signal swept from 50 Hz~7.5kHz.

NORMAL position

5. Thread a blank SCOTCH 150 tape on the unit, place RECORD MODE, EQ and BIAS switches at NORMAL, tape SPEED at 3-3/4 9.5cm  $\square$  position.
6. Repeat overall response check at both speeds and both directions.

### NOTE

If further adjustment is required, C-148, C-149 must be changed, if the high end response is too high, a lower value capacitor must be installed.

Fig. 7-9 Frequency Response -Record-

## SIGNAL TO NOISE RATIO

### PLAYBACK

#### IMPORTANT

OUTPUT control should be at specified output level. The signal to noise ratio must meet factory standards. The values given are obtained using an unweighted level meter while the supply and take-up motors have voltage applied but are not rotating. The values are with reference to a 3% THD peak recording level.

1. Thread a tape on the unit, leaving the tape outside the capstan and pinch roller.
2. Place the unit in the PLAY mode (▶) (the tape will not move).
3. The level meter connected to the LINE OUT jacks should indicate -56 dB or less.
4. This corresponds to a signal to noise ratio of 48 dB (difference between residual noise -56 dB and specified output level -8 dB for 1% THD). For a 3% THD signal to noise ratio, 6 dB is added, giving 54 dB (3% THD is 6 dB above 1% THD level).

Signal/Noise Computation

### OVERALL

#### IMPORTANT

Clean and demagnetize the heads before proceeding. It is extremely important that all tests described in the preceding paragraphs have been completed and that all controls adjusted are left unaltered.

1. Thread a record test tape (Scotch 203) on the unit.
2. Remove the AF oscillator from the LINE IN jacks.
3. Place the unit in the RECORD mode with no signal applied.
4. Note the point on the index counter where recording begins.
5. Rewind the tape and play it back.
6. The noise level as indicated on the level meter should be -54 dB or less.

#### NOTE

Bias, erase and playback amplifier noise are all included in this measurement. All frequencies between 40 Hz and 15 kHz are measured unweighted.

## ERASE EFFICIENCY

---

### NOTE

To measure erase efficiency, a 1 kHz band pass filter must be used.

Due to the high level of this signal, it is recommended that only a short recording be made (approximately 30 seconds) to prevent damage to the VU meter.

1. Apply a 1 kHz signal at 0 dB to the LINE IN jacks.
2. Place the unit in record mode and record this signal at 15ips.
3. Rewind the recording to the beginning and remove the AF oscillator from the LINE IN jacks.
4. Place the unit in record mode and record over this portion of tape again.
5. Rewind the tape to the starting point and connect a level meter to the LINE OUT jack through the 1 kHz band pass filter.
6. Play the erased portion of the tape.
7. The level meter should indicate -70 dB or less.

## LEVEL VARIATIONS

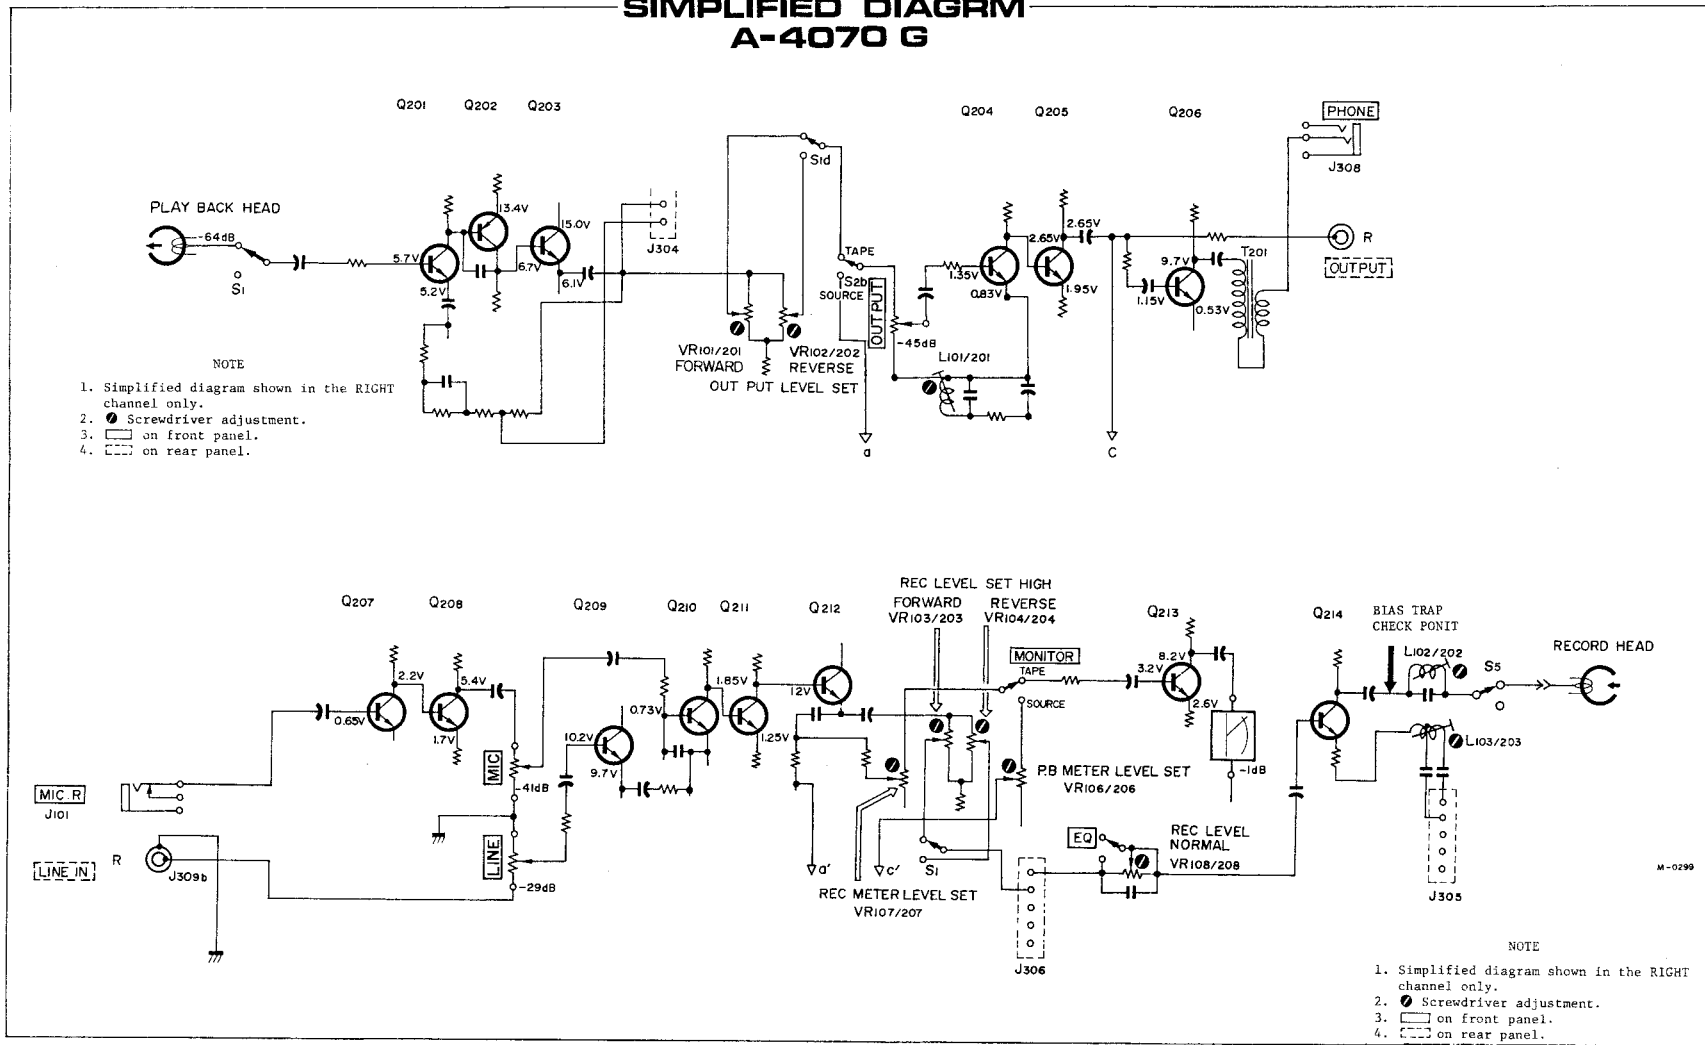

---

### IMPORTANT

Using Scotch 203 test tape, recorded at the specified level setting, during playback the output level variations should not exceed those shown in the below chart.

7-1/2ips	10kHz	1.5dB or less
3-3/4ips	5kHz	1dB or less

# SIMPLIFIED DIAGRAM A-4070 G

## 8 PREVENTIVE MAINTENANCE

Fig. 8-1 Maintenance Equipment

### CLEANING

If excess oxide accumulates on the surface of tape path components, normal operation and characteristics cannot be expected. Periodic cleaning should be done with proper cleaning materials. Refer to Operating Instructions.

### DEMAGNETIZATION

Metal parts in contact with the tape will become magnetized after long periods of use (except erase head). Magnetization of record/playback heads causes noise in recording and reproduction and heads should be demagnetized at every 50 hours of use, and before any important recording is done. Refer to Operating Instructions.

Fig. 8-2 Demagnetization

## LUBRICATION

---

Under normal conditions the unit will not require lubrication. Most of the bearings and bushings are of the oilless type. Since there are many rubber parts in the transport mechanism, excessive or improper lubrication could cause problems. If lubrication is required, the following points should be lubricated:

Capstan bushing, pinch roller shaft ..... 1 drop  
Motor ..... 1/2 drops in the plastic tubes

Parts to be lubricated should be cleaned and old oil and dirt removed before relubricating. Observe instructions as to type of oil, points to be lubricating.

Motors should be lubricated immediately after use while still warm. After oiling motors keep the unit in the horizontal position for 2-3 hours to allow thorough absorption of oil.

## VENTILATION

---

During use the face plate of the A-4070G may become quite warm to the touch, this entirely normal.

As long as the air vents in the rear plate are unobstructed, the unit will not overheat.

However, if the unit is placed snugly against a wall, or free air passage is prevented, overheating and possible damage may occur.

## 9 TROUBLE SHOOTING

The following guide lists specific difficulties that could occur in the A-4070G.

Several possible causes are listed for each malfunction. Visually inspect the unit for any damage such as broken or burned components or wiring, loose connections, etc.

MALFUNCTION	POSSIBLE SOURCE OF TROUBLE	CORRECTIVE PROCEDURE
Capstan fails to turn	Belt off or slipping, line fuse, shut off SW (S-805, S-806), phase advance cap. (C-801), shut off relay (K-8a), reverse relay (K-2a ~b), capstan motor, capstan assy.	Refer to schematic diagram and repair or replace the defective components.
Pinch roller fails to contact capstan in play mode	Remote control jumper plug not installed or loose, stop SW (S-804), play button (S-801), delay relay (K-4a), fast relay (K-5c), play relay (K-1b), micro SW (S-807), solenoid.	The normal DC resistance of the capstan solenoid is 1.3 kΩ. Refer to schematic diagram and repair or replace the defective components.
Right reel does not rotate in the forward play mode	Reverse relay (K-2c), fast relay (K-5a), resistor (R-801).	Refer to schematic diagram and repair or replace the defective components.
Left reel does not rotate in the forward	Reverse relay (K-2c), fast relay (K-5b), resistors (R-802, R-803).	Refer to schematic diagram and repair or replace the defective components.
Right reel does not rotate in the reverse play mode	Reverse relay (K-2c), fast relay (K-5a), Resistor (R-802, R-803)	Refer to schematic diagram and repair or replace the defective components.
Left reel does not rotate in the reverse play mode	Reverse relay (K-2d), fast relay (K-5b), resistor (R-801).	Repair or replace defective components.
Tape transport does not operate in fast forward	Fast relay (K-5, K-11a), fast SW (S-803), Diodes (D-8, D-6).	Refer to schematic diagram and repair or replace the defective components.
No delay	Delay relay (K-4), cap. (C-807, C-808), reverse relay (K-3c ~d), resistor (R-805), Diode (D-5).	Repair or replace defective components.
Wow and flutter	Defective tape, dirty or defective pinch roller, oily or defective belt, reel motor tension.	Clean or replace defective components. Adjust motor tension.
Incorrect tape speed	50/60Hz cycle change knob in wrong position. Incorrect pinch roller pressure.	Reset change knob. Adjust pinch roller pressure.

MALFUNCTION	POSSIBLE SOURCE OF TROUBLE	CORRECTIVE PROCEDURE
No muting	Muting relay(K-12), muting diagram, delay relay(K-4c), play relay(K-1d), jack loose(J-303).	Refer to muting diagram, and replace the defective components.
Both reel motors fail to operate	Play relay(K-1a)	Replace the defective components.
No forward play	Remote control jumper plug missing or loose, play button(S-801), play relay (K-1), diode(D-4), sensing ampl.	Repair or replace defective components.
No reverse play	Play button(S-802), reverse relay(K-2,K-3), diode(D-4), sensing ampl.	Repair or replace defective components.
Auto-reverse does not function with and sensing fail	Fail length too short, sensing post dirty, sensing ampl., sensing relay(K-6).	Fail should be 1/2" long, clean sensing post.
Repeat operation faulty	Fail length too short, sensing post dirty, repeat switch(S-8), not on or faulty, sensing relay(K-7), sensing ampl.	There is a built-in 40 sec. recycling period for the repeat unit. It will not operate if a repeat cycle of less than 40 seconds is required.
No playback	Playback head dirty, amplifier to deck connection (J-301), monitor switch, playback ampl., Delay relay (K-4c), play relay(K-1d), muting relay(K-12), muting diagram.	Refer to playback ampl., voltage chart.
Playback noise or hum	Faulty connections, head selector switch(S-1a <sup>v</sup> b) faulty playback head, and ampl.	Repair or replace defective components.
Noise or hum during record	Magnetized head, faulty connections(J-301), MIC level set to max., record ampl. bias osc.	Demagnetize and clean head, repair or replace defective components.
No record or no erase	Bias osc., erase/record head dirty, record jack loose(J-302), master VR jack loose(J-306), record relay(K-301), record Sw. (S-10), record ampl., resistor(R-303), record selector switch(S-6,S-7).	Refer to schematic diagram and repair or replace the defective components. Voltage chart.

## 10 PACKING FOR SHIPMENT

### SHIPPING INSTRUCTIONS

If the unit is to be sent back to the TEAC factory (service department) for repair, carefully pack as shown below.

M-0277

# TEAC® A-4070G

PARTS LIST

## REPLACEMENT INFORMATION

Replacement parts are available through your nearest TEAC dealer or directly from the TEAC office.

Changes are constantly being made to make TEAC products better and more reliable.

Therefore, when ordering parts, always include the following information:

<i>MODEL</i>	<i>SERIAL NO.</i>	<i>REF.NO.</i>	<i>PARTS NO.</i>	<i>DESCRIPTION</i>

# PRINTED CIRCUIT BOARD AND PARTS LIST

## A-4070G

### REPLACEMENT INFORMATION

Replacement parts are available through your nearest TEAC dealer or directly from the TEAC office.

Changes are constantly being made to make TEAC products better and more reliable.

Therefore, when ordering parts, always include the following information:

<i>MODEL</i>	<i>SERIAL NO.</i>	<i>REF.NO.</i>	<i>PARTS NO.</i>	<i>DESCRIPTION</i>
--------------	-------------------	----------------	------------------	--------------------
