How to install and remove the connection socket

1. Insert the lead wire into the lead wire pin clamp. (See fig. 1-①)
2. Bend the tabs of the lead wire pin clamp using radio pliers to attach the lead wire. (See fig. 1-② and ③)
3. Insert the lead wire pin clamp, to which the lead wire has been attached, into the connection socket. (See fig. 2)
4. In order to remove the lead wire pin clamp from the connection socket, insert an eyeletter into the socket hole and touch it to the lead wire pin clamp stop. (See fig. 3-①)
5. Bend the stop inward toward the lead wire pin clamp and pull out the lead wire pin clamp. (See fig. 3-②)

Fig. 3

When the measuring instrument is connected to the speaker terminals with the balanced transformerless connection, the following should be noted: There are some measuring instruments whose ground (GND) terminal is connected directly to the negative side of the input terminal. If the instrument used for measurement is so designed, extreme care should be given that the ground terminal of the instrument not be connected to the ground terminal of the set. If care is not exercised and the connection is made, excessive electric current will flow in the direction of the arrow, as shown in the diagram, causing the rear amplifier to reach a short-circuit condition. When this occurs, the circuit protecting fuse will be blown, interrupting the circuit. Please be careful.
