TECHNICAL GUIDE

Power-indication circuitry

The power amplifier output signal is attenuated by the sensitivity selector, and is applied to the logarithmic-compression circuitry. In this circuitry, as shown in figure 1, the output characteristics change logarithmically in relation to input, and the output is applied to the window comparator IC. Here, the pulse waveform becomes as shown in figure 2, and the indicator illuminates according to the input of the IC (the output of the power amplifier).

Fig. 1

Tone-control circuitry

Fig. 3

Configuration is as shown in figure 3. Bass and treble are the BAX type of control circuitry, and a bandpass filter is used for control of intermediate frequencies. If the middle control is moved in direction A, a valley-like characteristic can be obtained. If it is moved in direction B, a peak-like characteristic can be obtained.

ALIGNMENT INSTRUCTIONS (Main Amplifier Circuitry) — ENGLISH

Main amplifier (Ic) alignment Refer to fig. 4.

1. The "Ic" adjustment should be started about 5 minutes after setting the power switch to the ON position.
2. Speakers switch to "push" position.
3. Connect DC voltmeter between TP601 and ⊕ speaker terminal of right channel.
4. Adjust VR602 to 12 mV on DC voltmeter indication.
5. Connect DC voltmeter between Emitter (TR613) and ⊕ speaker terminal of left channel.
6. Adjust VR601 to 12 mV on DC voltmeter indication.

Power level indication alignment Refer to fig. 4.

1. Connect AC VTVM to speakers terminal. (Left and Right channels)
2. Power display switch to "ON" position and display range switch to "XO. 1" position.
3. Selector switch to "AUX" position.
4. Apply a 1 kHz signal to "AUX" terminal. (Left and Right channels)
5. Volume control to maximum position of set.
6. Adjust supply signal level to 12.6V ~ 12.7V output of speaker terminal.
7. Adjust VR801 (Left channel) and VR802 (Right channel) until "200W" indicator lights up.

Fig. 4 (Abb. 4)

■ CHASSIS VIEW

■ **NOTE** The unit is provided with the speaker circuit protection fuses at the right and left channels respectively. The fuse is to prevent the power transistor from destruction, should the speaker terminals be short-circuited. Accordingly, if the unit fails to function upon completion of the speaker connections, check the speaker circuit protection fuses first of all for possible blowing.

■ DIAL CORD INSTALLATION GUIDE

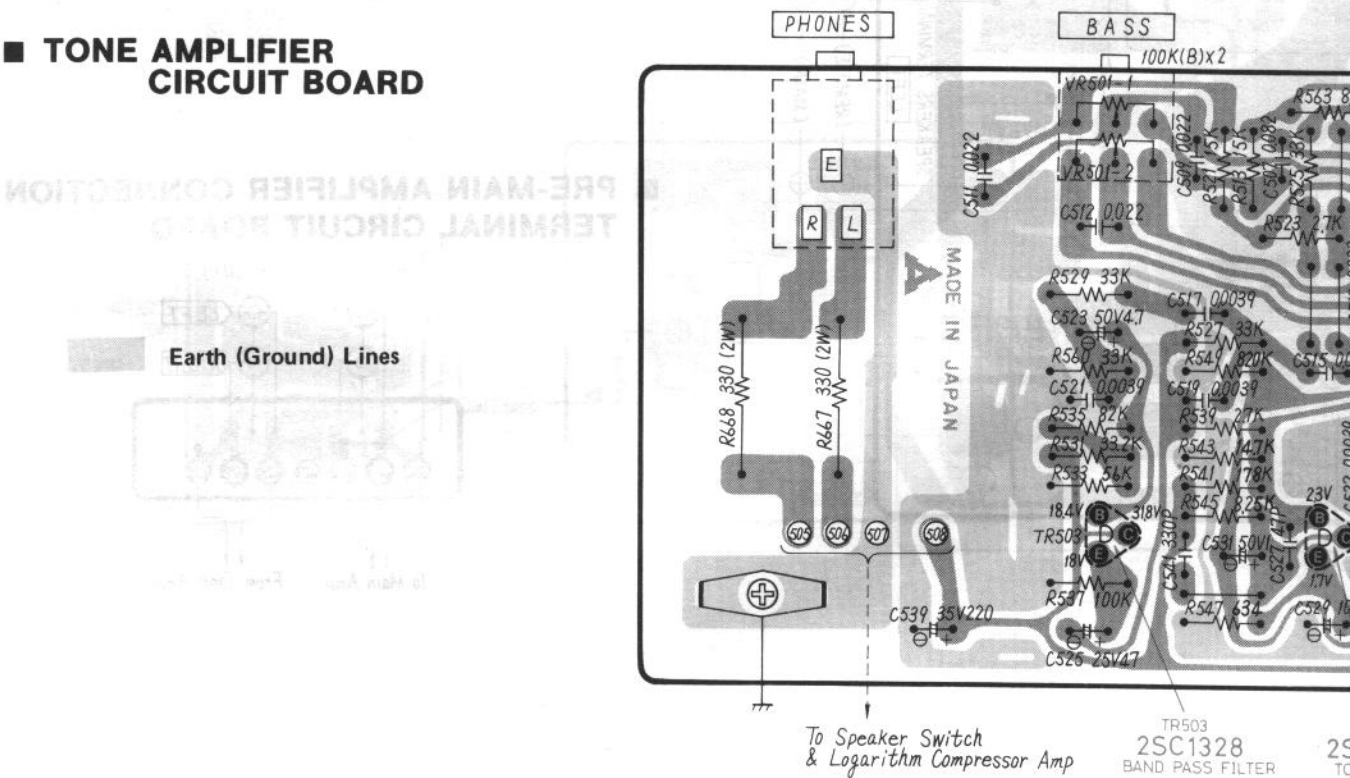

- For threading a fresh cord, proceed as follows.
 1. Prepare a fresh cord more than 220cm (86-3/8") in length.
 2. Bring the variable capacitor into a state where the drum is completely turned to the right (maximum capacity and lowest frequency for the variable capacitor).
 3. Direct the cord in the order from 1 to 10.
 4. Stretch the cord in such a tension as the spring length is elongated by 1.5 times that of the original state.
 5. Fix the knot of the cord with the bond.
