T4P is the standard mark for plug-in-connector system Products carrying this mark are interchangeable and compatible with each other

SPECIFICATIONS

■ TURNTABLE SECTION

Type: Quartz direct drive
Automatic turntable
Auto-start
Auto-return
Auto-stop
Repeat play
Manual play

Drive method: Direct drive

Motor: Brushless-DC motor

Drive control method: Quartz phase locked control

Turntable platter: Aluminum die-cast
Diameter 31.2 cm (12-9/32")

Turntable speeds: 33-1/3 rpm and 45 rpm

Wow and flutter: 0 012% WRMS*
0.025% WRMS (JIS C5521)
±0 035% Weighted zero to peak
(IEC 98A weighted)

* This rating refers to turntable assembly alone, excluding effects of record, cartridge or tonearm, but including platter Measured by obtaining signal from built-in frequency generator of motor assembly

Rumble: −56 dB DIN-A
(IEC 98A unweighted)
−78 dB DIN-B
(IEC 98A weighted)

■ TONEARM SECTION

Type: Static-balanced straight tonearm
Plug-in-connector cartridge system

Effective length: 230 mm (9-1/16")

Overhang: 15 mm (19/32")

Tracking error angle: Within 2°32' at outer groove of 30 cm (12") record
Within 0°32' at inner groove of 30 cm (12") record

Effective mass: 13.5 g (including cartridge)

Stylus pressure adjustment range: 1 25±0 25 g

Applicable cartridge weight: 6 g

■ CARTRIDGE SECTION
(Except for U.S.A. and Canada)

Type: Moving magnet stereo cartridge

Magnet circuit: All laminated core

Frequency response: 10 Hz~40 kHz

Output voltage:	2.5 mV at 1 kHz, 5 cm/s zero to peak lateral velocity (7 mV at 1 kHz, 10 cm/s zero to peak 45° velocity [DIN 45 500])
Channel separation:	More than 22 dB at 1 kHz
Channel balance:	Within 1 8 dB at 1 kHz
Recommended load impedance:	47 kΩ~100 kΩ
Compliance (dynamic):	12×10^{-6}cm/dyne at 100 Hz
Stylus pressure range:	1 25±0.25 g (12 5±2.5 mN)
Weight:	6 g (cartridge only)
Replacement stylus:	EPS-30ES

■ GENERAL

Power supply:	For U S.A. and Canada AC 120V, 60 Hz For United Kingdom and Australia AC 240V, 50 Hz For continental Europe AC 220V, 50 Hz For others. AC 110~127/220~240V, 50/60 Hz
Power consumption:	8 W
Dimensions (W×H×D):	430×100×375 mm (16-15/16"×3-15/16"×14-3/4") When dust cover is open 430×370×410 mm (16-15/16"×14-9/16"×16-1/8")
Weight:	4 5 kg (9 9 lb)

Specifications are subject to change without notice for further improvement.
Weight and dimensions shown are approximate

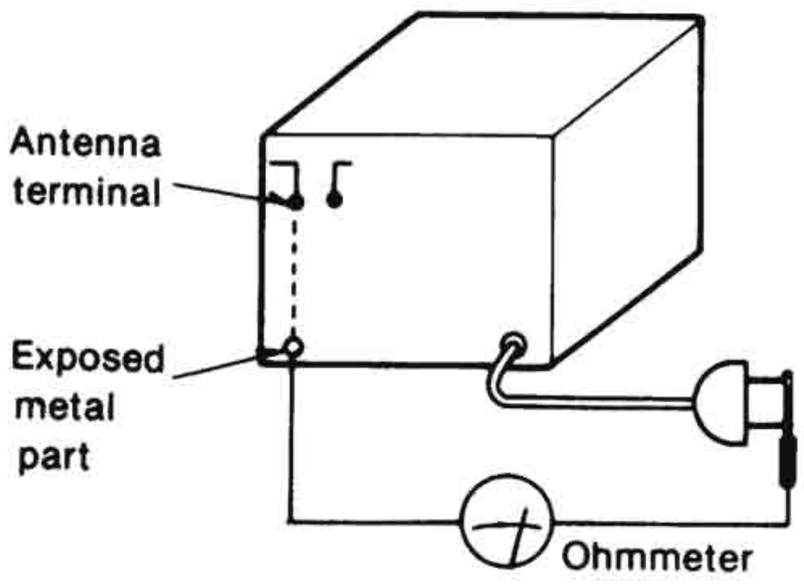
■ SAFETY PRECAUTION (This "safety precaution" is applied only in U.S.A.)

1. Before servicing, unplug the power cord to prevent an electric shock.
2. When replacing parts, use only manufacturer's recommended components for safety
3. Check the condition of the power cord. Replace if wear or damage is evident.
4. After servicing, be sure to restore the lead dress, insulation barriers, insulation papers, shields, etc.
5. Before returning the serviced equipment to the customer, be sure to make the following insulation resistance test to prevent the customer from being exposed to a shock hazard.

• INSULATION RESISTANCE TEST

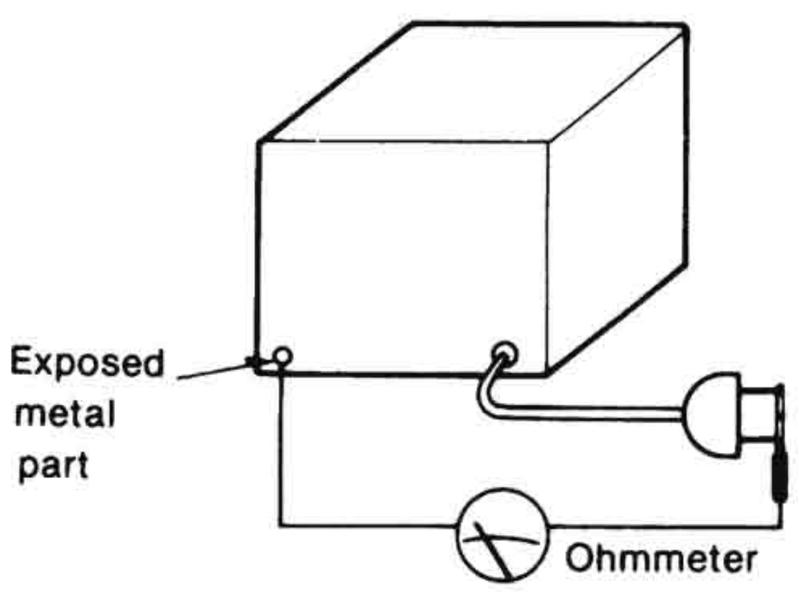
1. Unplug the power cord and short the two prongs of the plug with a jumper wire.
2. Turn on the power switch.
3. Measure the resistance value with ohmmeter between the jumpered AC plug and each exposed metal cabinet part, such as screwheads, antenna, control shafts, handle brackets, etc Equipment with antenna terminals should read between 3MΩ and 5.2MΩ to all exposed parts. (Fig. A) Equipment without antenna terminals should read approximately infinity to all exposed parts. (Fig. B)

Note: Some exposed parts may be isolated from the chassis by design. These will read infinity.



(Fig A)

Resistance = 3MΩ—5 2MΩ

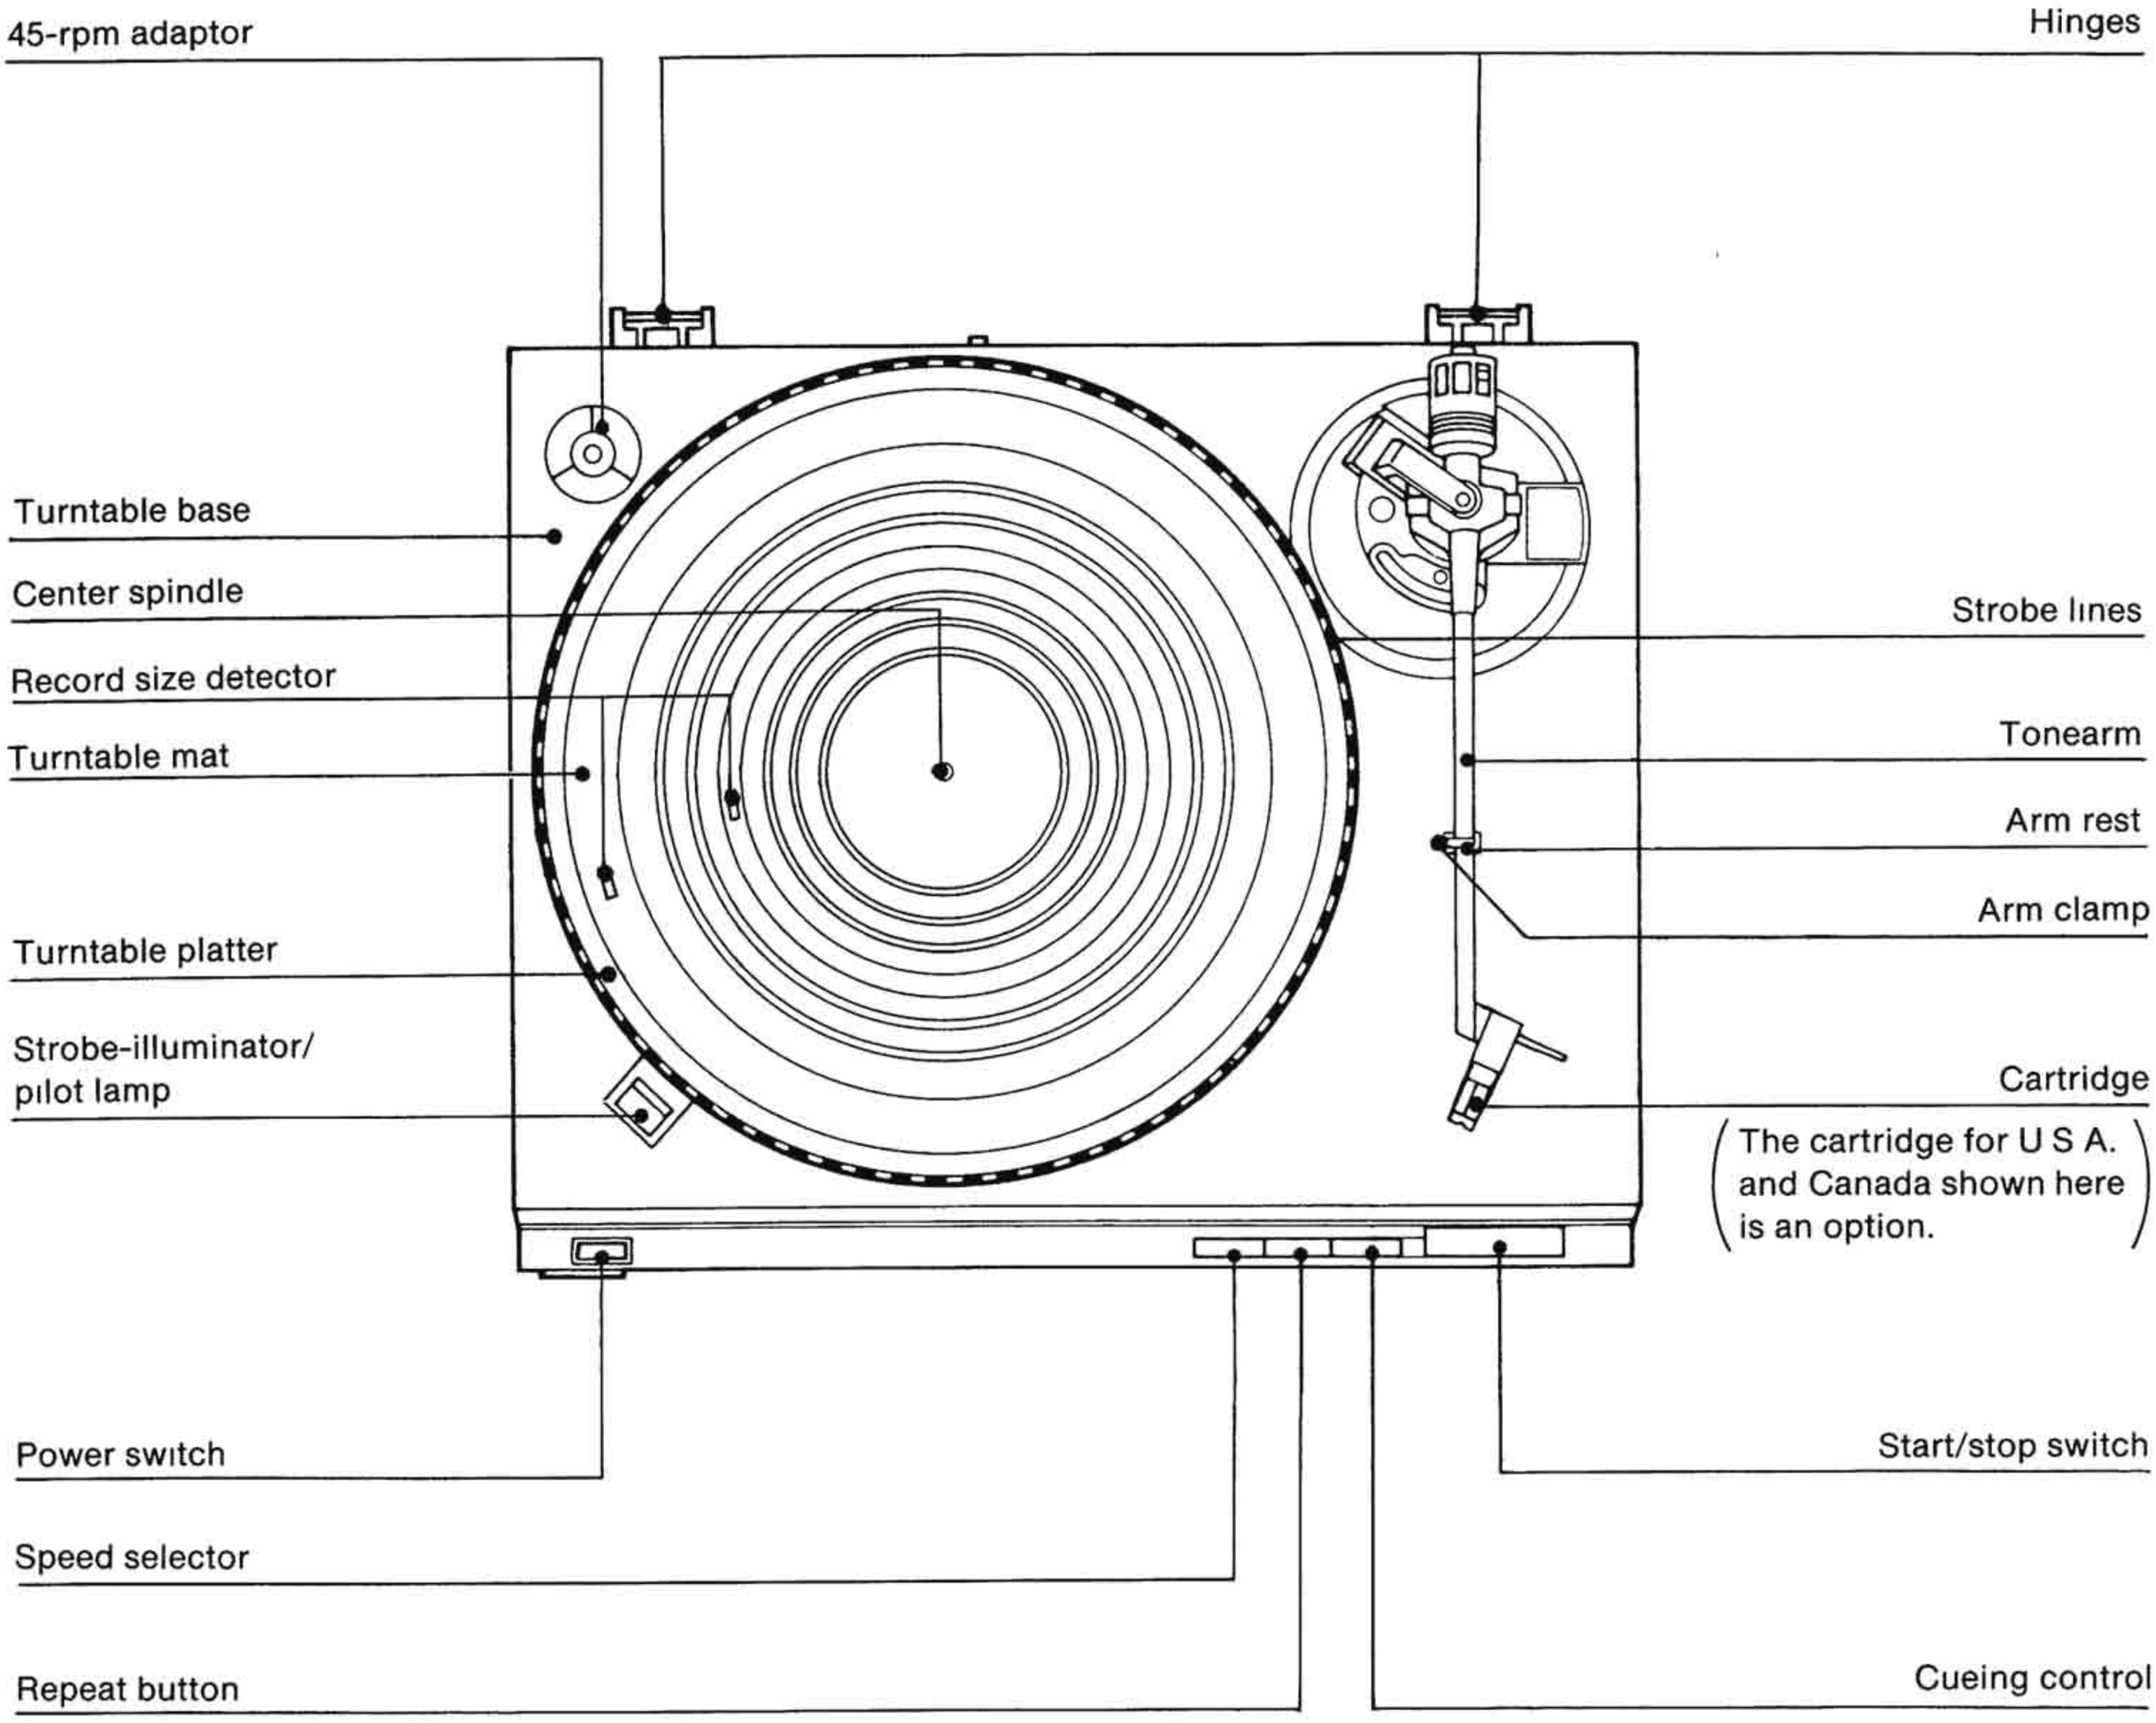


(Fig. B)

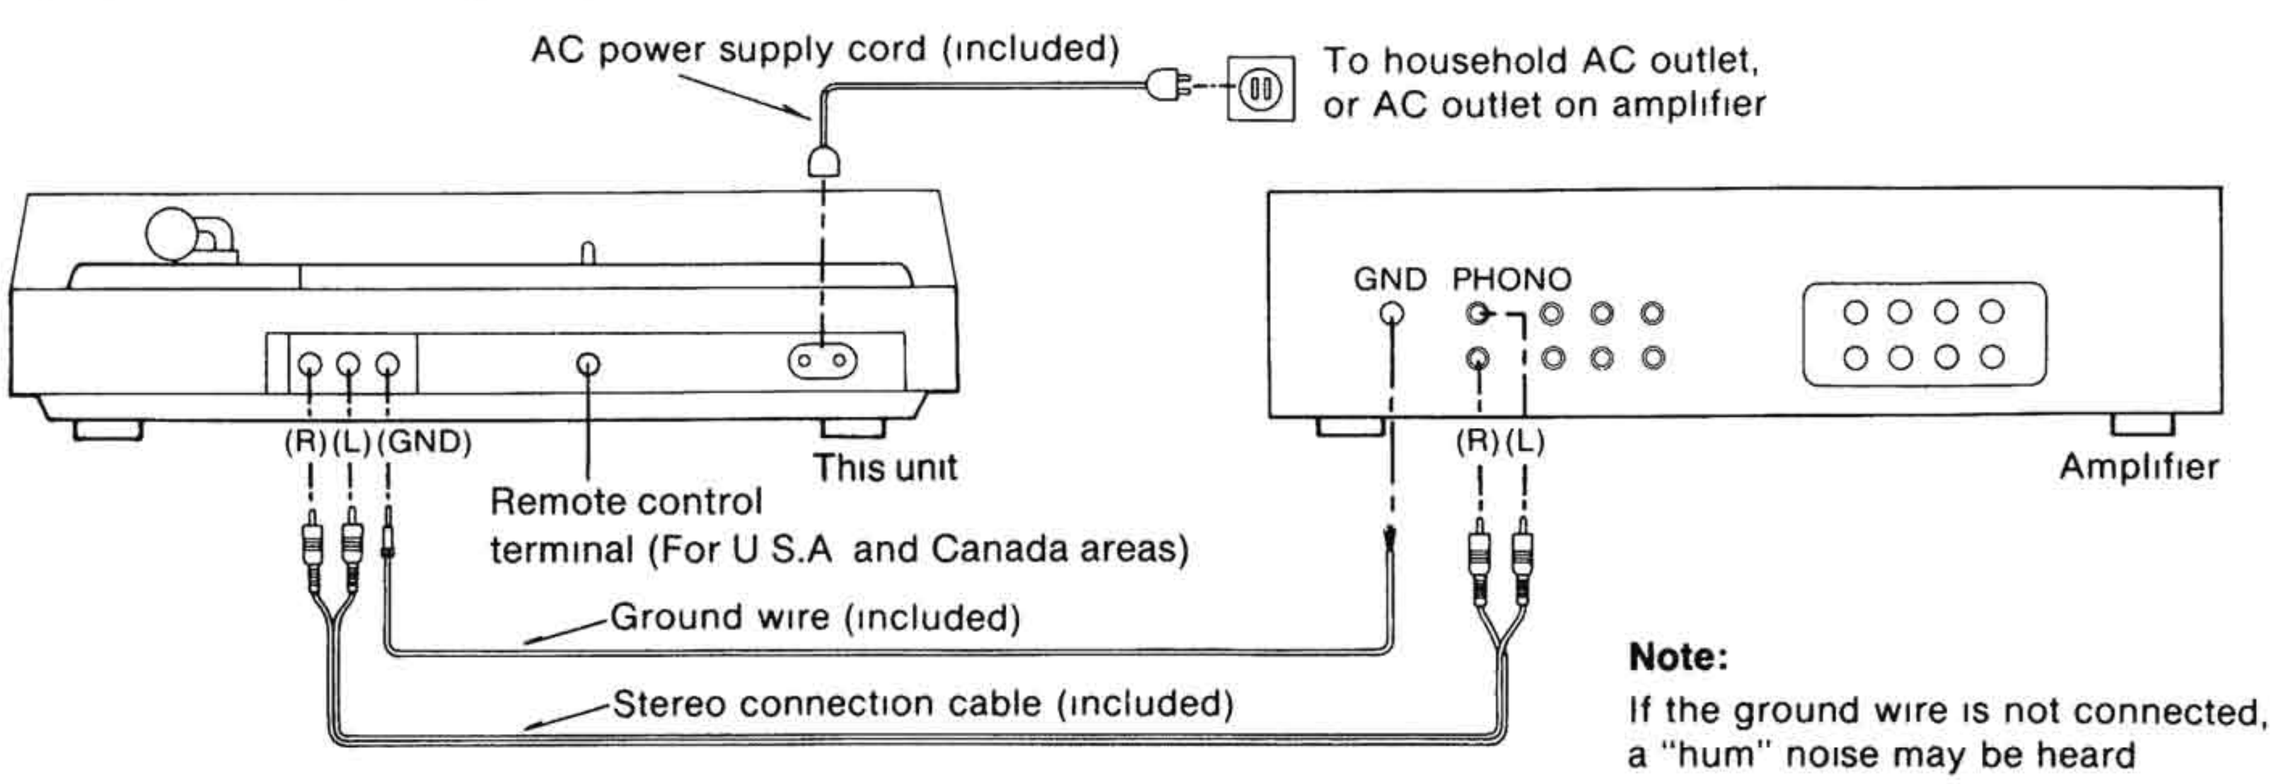
Resistance = Approx ∞

4. If the measurement is outside the specified limits, there is a possibility of a shock hazard. The equipment should be repaired and rechecked before it is returned to the customer

■ LOCATION OF CONTROLS



■ CONNECTIONS



Note:

If the ground wire is not connected, a "hum" noise may be heard

■ DISASSEMBLY INSTRUCTIONS

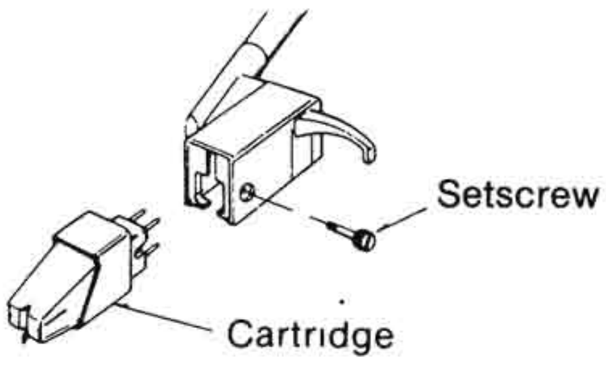
Ref. No 1	How to remove the cartridge

Procedure 1

Note

When servicing, remove the cartridge or stylus in order to protect the stylus tip of cartridge.

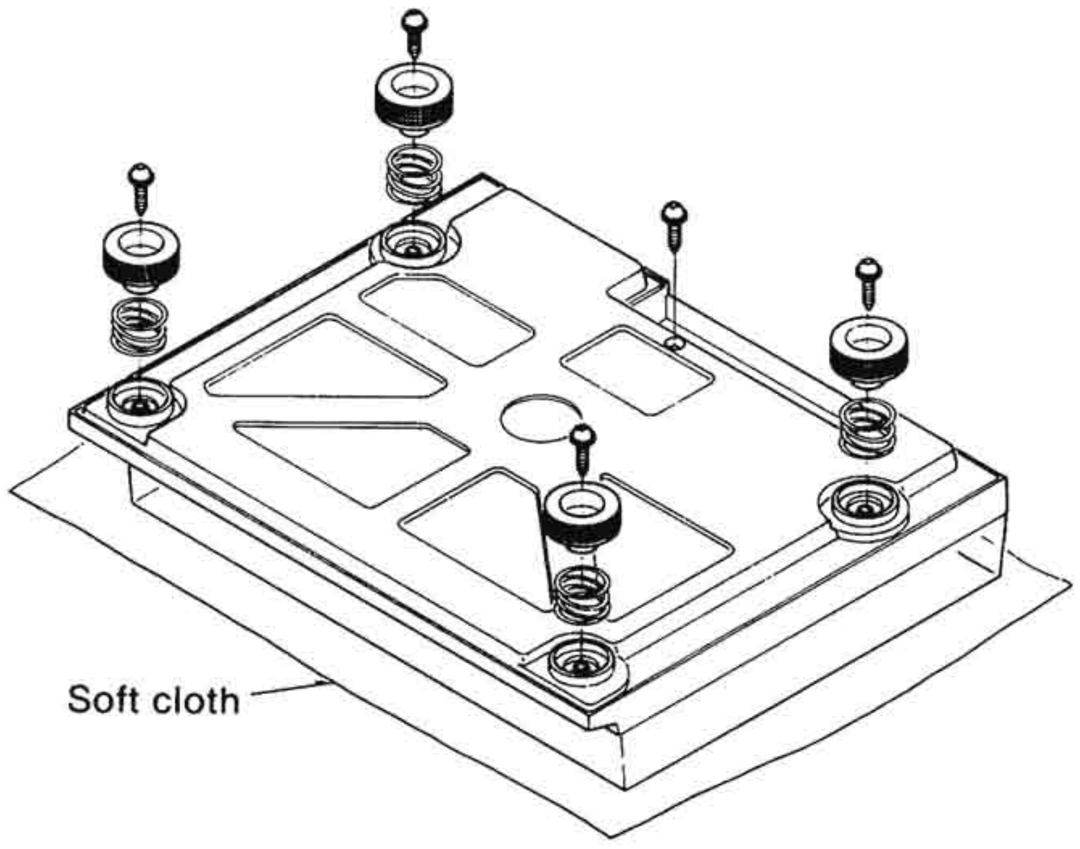
- Remove the setscrew and pull out the cartridge, taking care that your hand does not touch the stylus tip.



Ref. No 2	How to remove the bottom board

Procedure 2

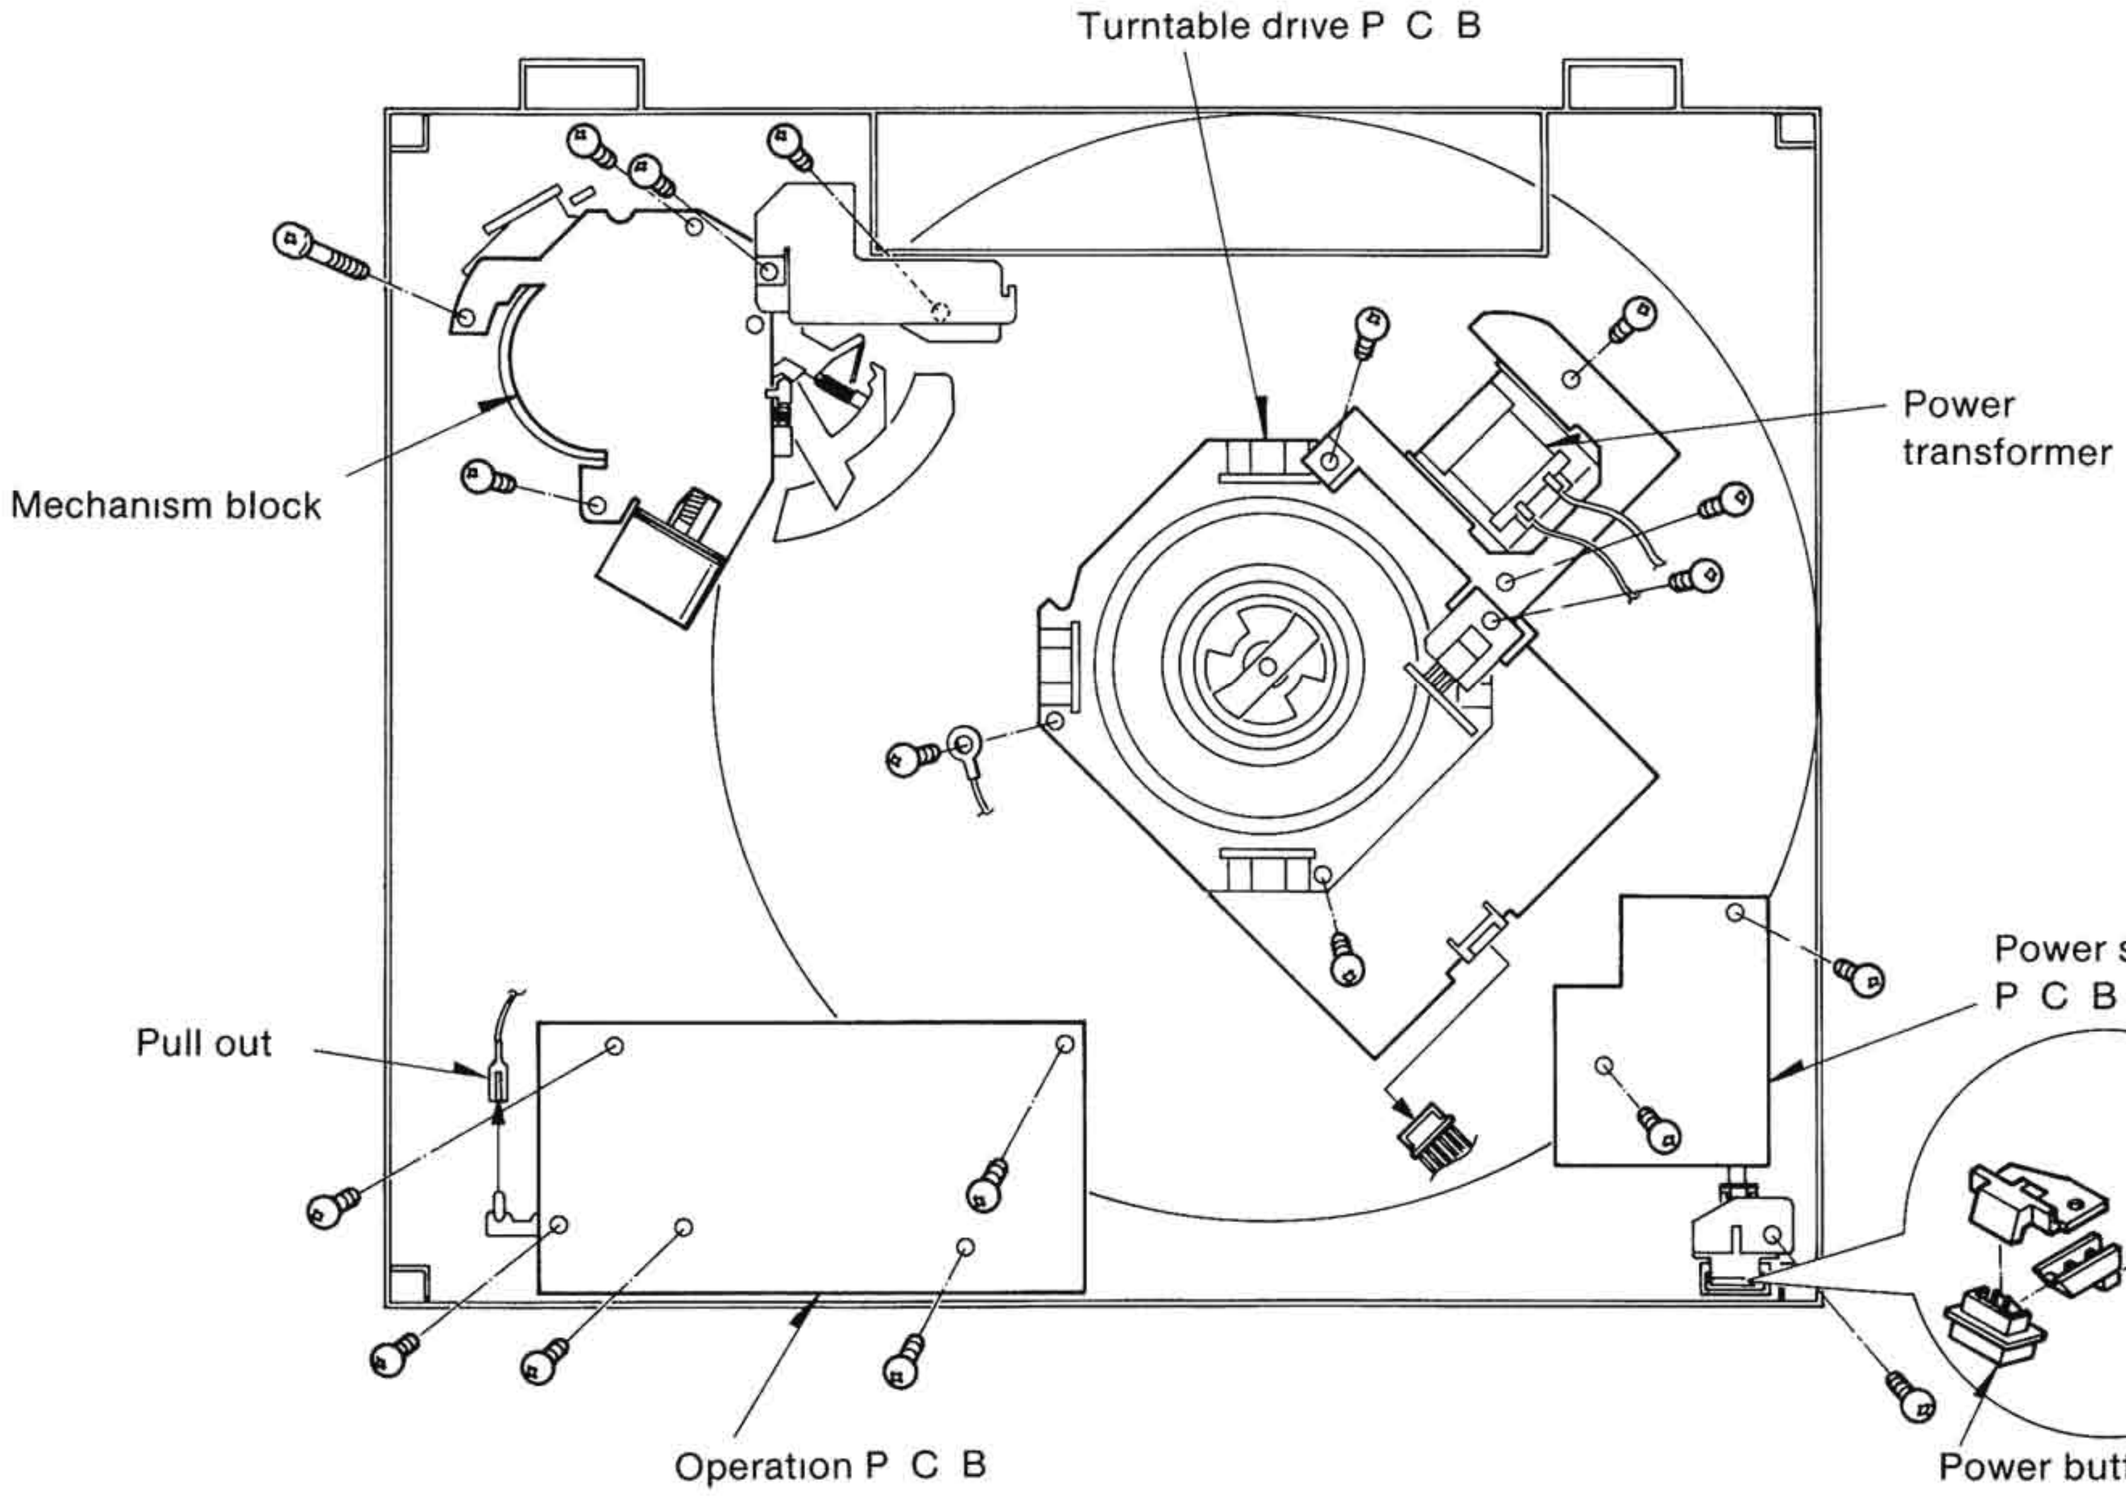
1. Secure tonearm with arm clamp.
2. Remove the turntable platter.
3. Turn over the unit on a soft cloth.
4. Remove the 5 setscrews.



Ref. No 3	How to remove the each block

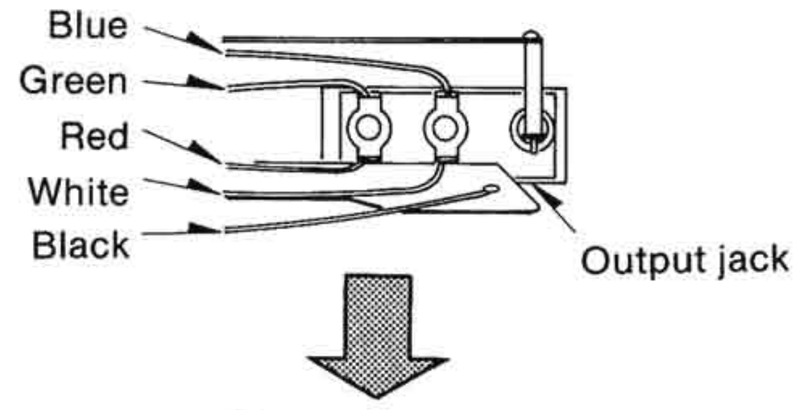
Procedure 2 ➧ 3

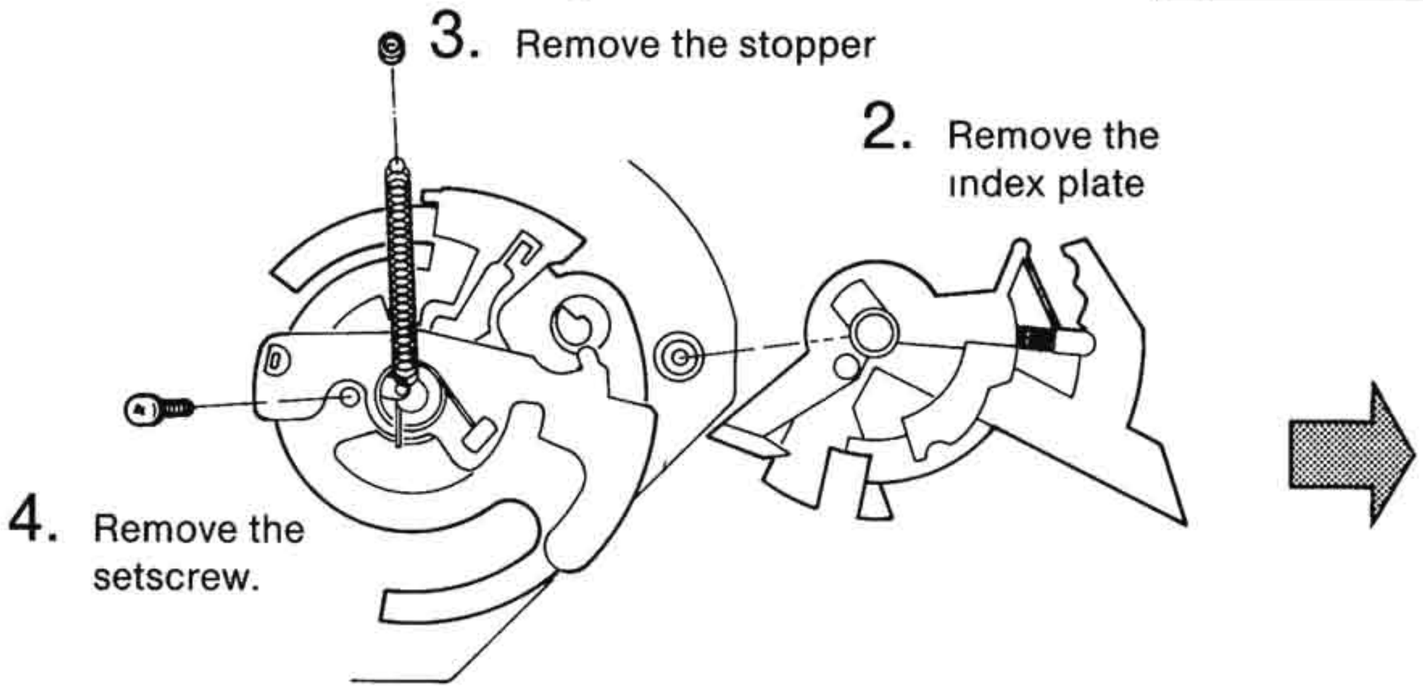
- Remove the setscrews of each black as shown in drawing.



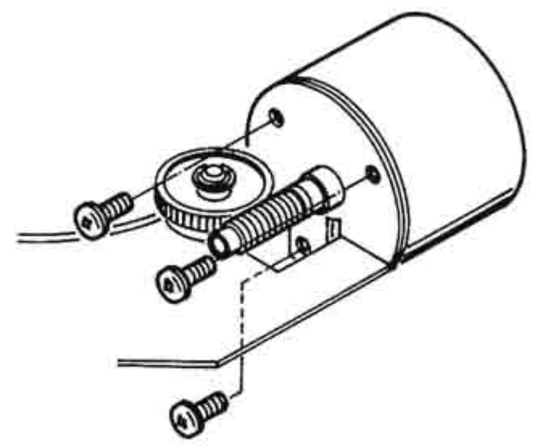
Ref. No 4	How to remove the tonearm
Procedure 3 ➧ 4	1 Remove the mechanism block. 2. Remove in the numerical order shown

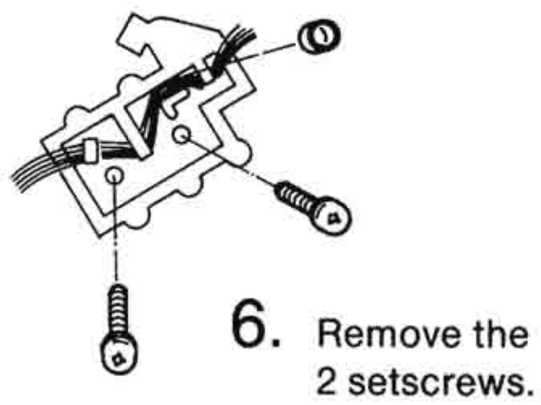
1. Unsolder the 5 lead wires.



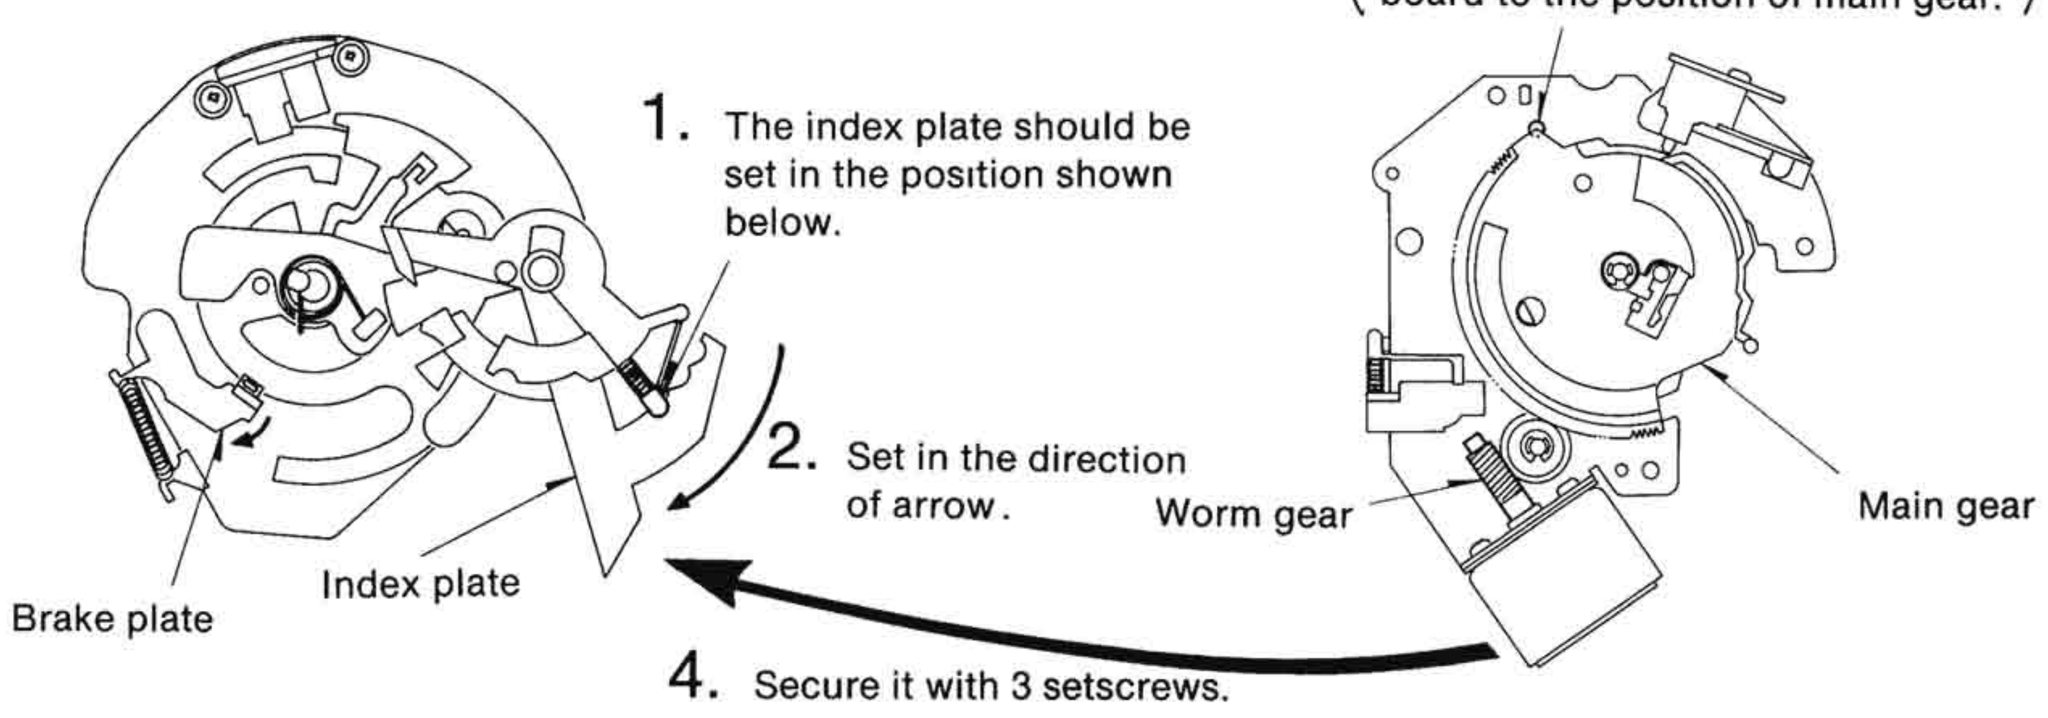


Ref. No 5	How to remove the motor
Procedure 3 ➧ 5	• Remove the 3 setscrews.





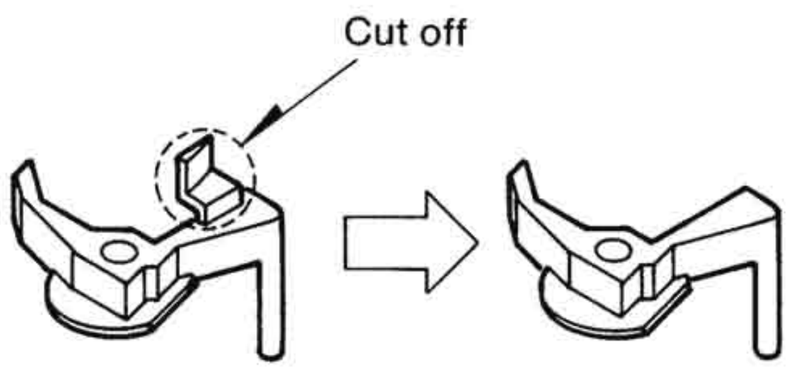
Ref. No 6	How to fit the mechanism board
Procedure 6	1. Secure tonearm with arm clamp. 2. Fit in the numerical order.



Note: In this condition, tonearm is in the state of "cueing up", but it will be shifted to "cueing down" when power switch is turned "on" after assembly.
It can be installed in the initial state, but in that case the brake plate touches the main gear Therefore, pull the brake plate when installing

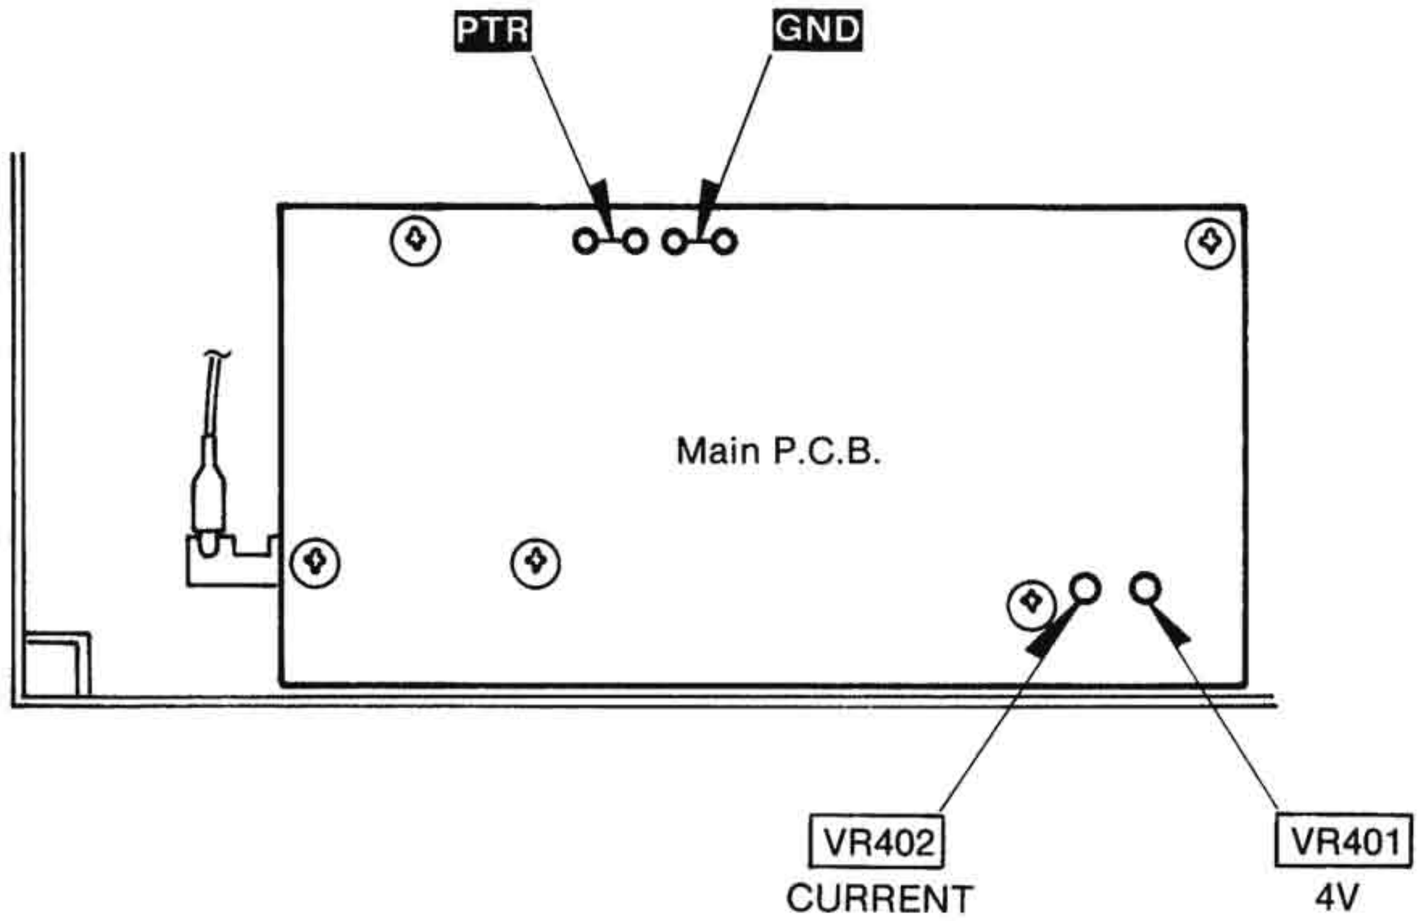
- **Movable piece cutting**

When using the movable piece for this unit, cut off the part as shown by using nippers



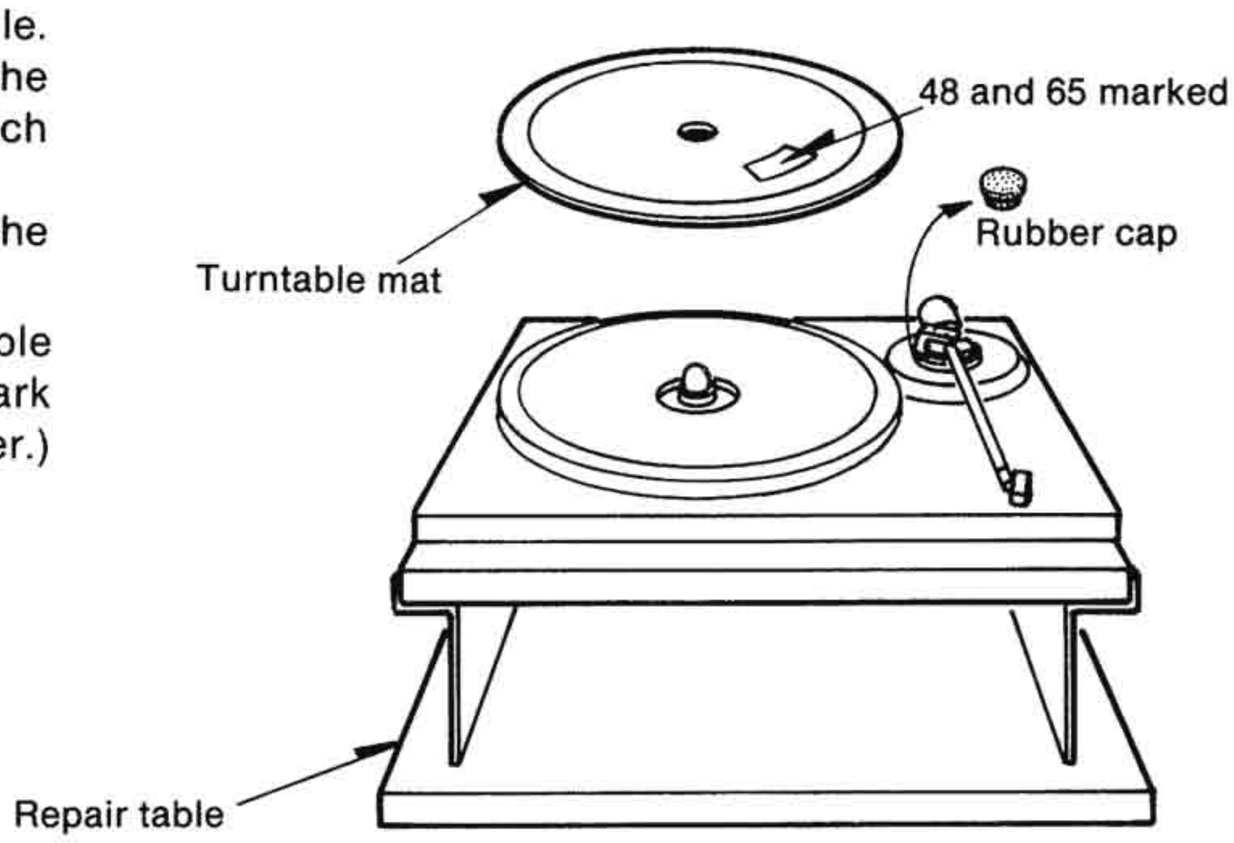
■ MEASUREMENTS AND ADJUSTMENTS

ADJUSTMENT POINTS



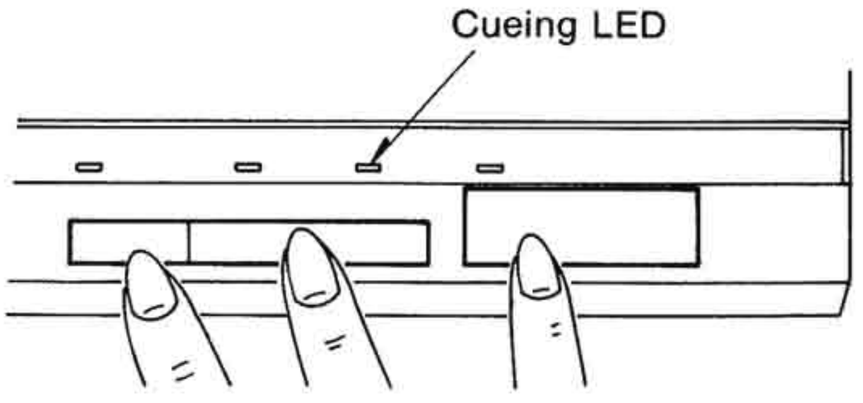
STATE OF SET

1. Remove the bottom plate and put it on the repair table.
2. Make sure that the tonearm is free (cueing down) in the rest position. (If it is not free, turn on the power switch and wait until the tonearm is free.)
3. Set the stylus cover on the cartridge, and remove the rubber cap of arm base.
4. Turn over the turntable mat and put it on the turntable platter. (The turntable mat is provided with match mark at the position R65 mm and R48 mm from the center.)



PROCEDURE BEFORE ADJUSTMENT

The microcomputer used in this unit has a function to select normal and adjustment modes. There are **Test 1** and **Test 2** for the adjustment mode. So, check the mode before making the adjustment.



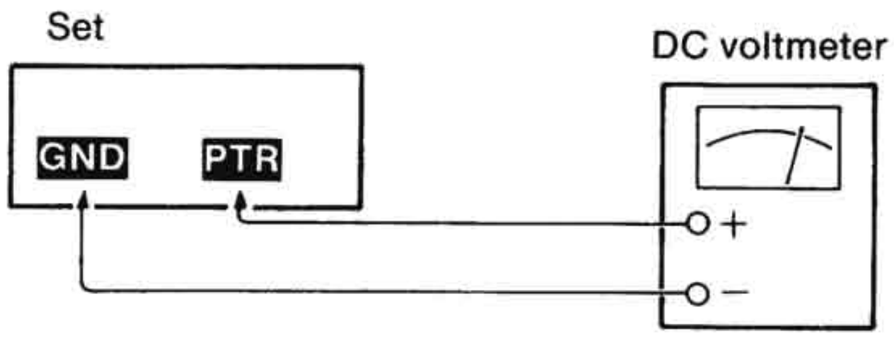
How to select the adjustment mode

1. **Test mode 1**
   Before turning **on** the power switch, make sure that the tonearm is free in the rest position, and set all the 4 operation keys to **on** (pressing all the keys with fingers). Subsequently, turn **on** the power swith. **(In the test mode, the turntable will not rotate even when the tonearm is moved inwards.)**
2. **Test mode 2**
   Press the Stop key once in the state of Test mode 1.
3. **Normal mode**
   Press the Stop key once in the state of Test mode 2

CURRENT ADJUSTMENT

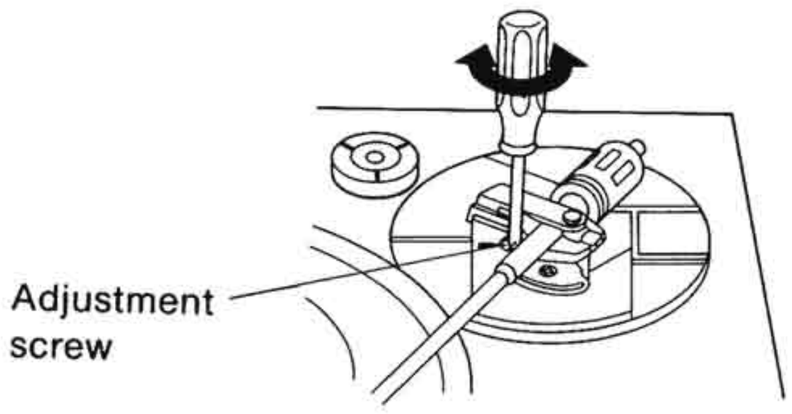
1. Set the microcomputer to **Test mode 1**.
2 Connect DC voltmeter to **PTR** (+) and **GND** (−) of P.C.B.
3 Move the tonearm to the position where the reading of DC voltmeter is **8V±0.005V**.
4 Adjust **VR402** so that cueing LED lights up.
5. After the LED lights up, be sure to turn off the power switch.

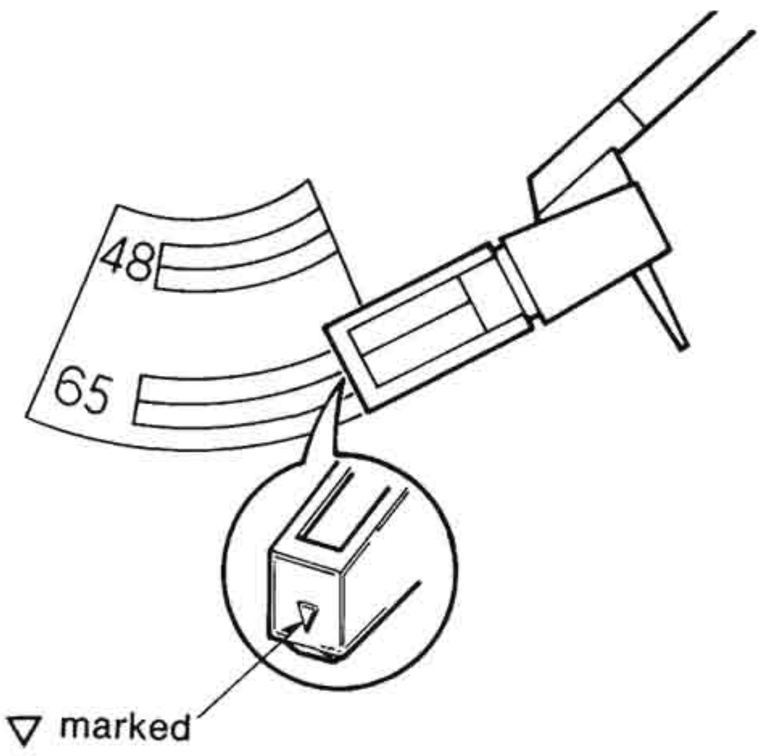
(Be sure to turn off the power switch before the next adjustment.)



8V ADJUSTMENT

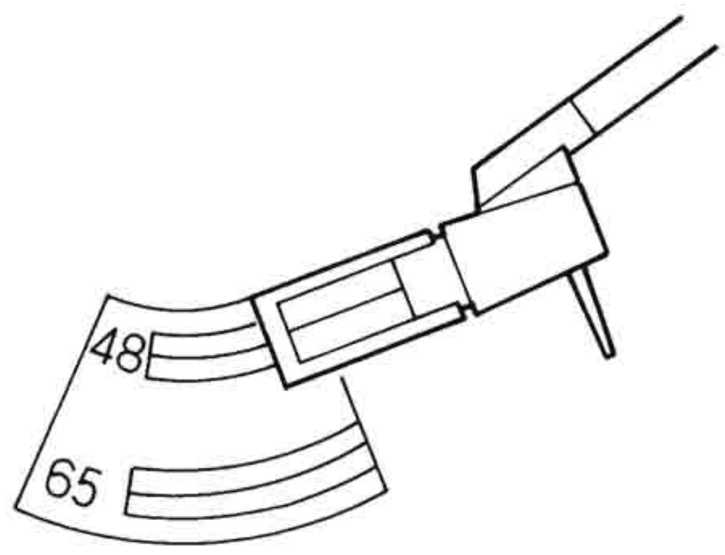
1. Set the microcomputer to **Test mode 1**.
2 Manually fix the stylus cover in the **65** position of turntable mat, matching the marks (▽).
3. Turn the **shutter plate adjusting screw** in the adjusting hole of the arm base so that the **cueing LED lights up**.





4V ADJUSTMENT

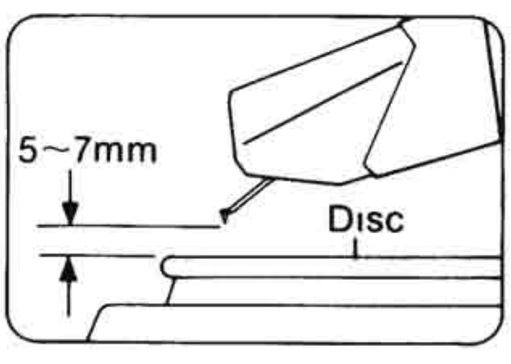
1. Press the Start/Stop key or Stop key and shift the mode to **Test 2** (In SL-QD33, Repeat LED lights up.)
2. Manually fix the stylus cover in the **48** position of turntable mat, matching the marks (▽).
3. Turn **VR401** so that the **cueing LED lights up**.
4. Return the tonearm to the rest position and press the Start/Stop or Stop key, then the mode is reset to the normal mode.

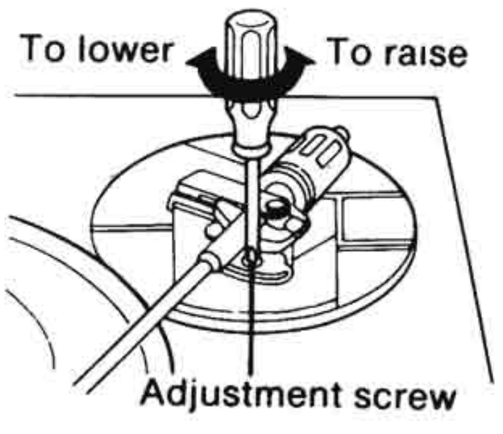


ADJUSTMENT OF THE STYLUS-TO-DISC CLEARANCE

Make this adjustment if the cartridge is replaced, or at any other time an adjustment is necessary because of the length of the stylus being used. (This adjustment is usually unnecessary.)

1. Set the cueing control to "▽".
2. Move the tonearm to a position above the disc.
3. Adjust the stylus tip position.



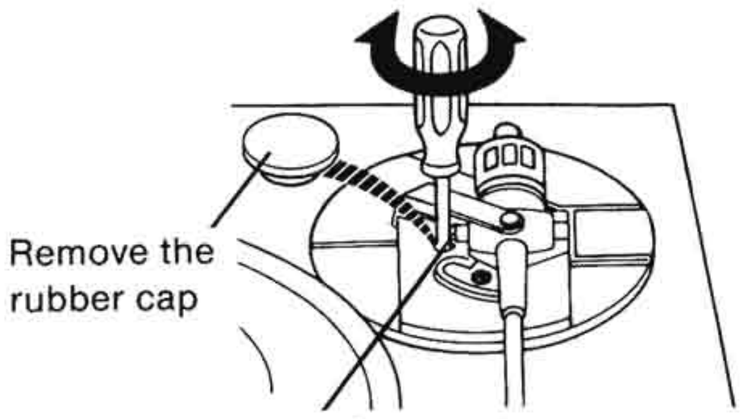


AUTOMATIC START POSITION

If the stylus does not land in the lead-in groove, adjust as follows.

1. Clamp the tonearm to the arm rest.
2. Remove the rubber cap.
3. Turn the screw with a screwdriver, clockwise or counterclockwise as necessary.

If the stylus tip sets down too far in the recorded groove,
—turn counterclockwise.
If the stylus tip sets down outside of the record,
—turn clockwise.
Adjust so the stylus tip lands 1—2 mm in from the edge of the record



Auto-start adjustment screw

■ TECHNICAL GUIDE

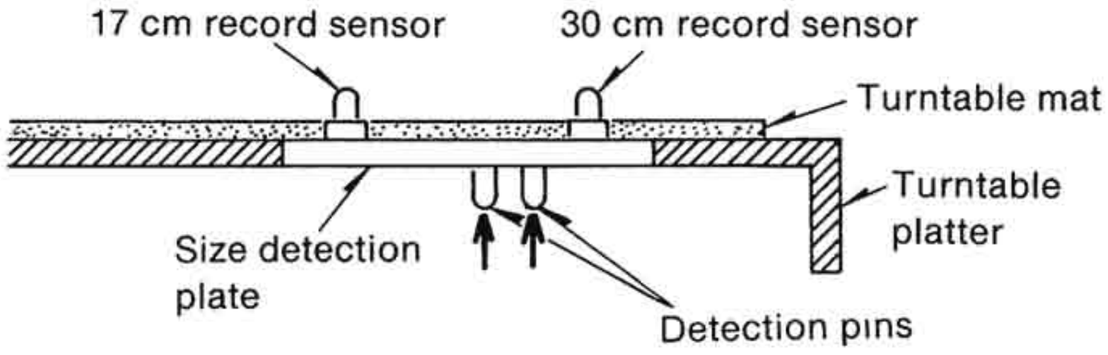
Unlike the conventional mechanism, the automatic operation mechanism of this unit has been improved in performance employing a new mechanism with microcomputer and motor for automatic operation and an optical end detection system.

Description of Mechanism

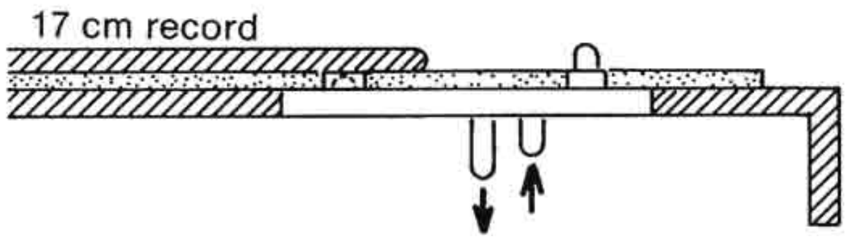
1. Record size detection

The presence of record and its sizes 17 cm and 30 cm are detected by the size detection plate of the turntable platter and the index plate attached to the main body.

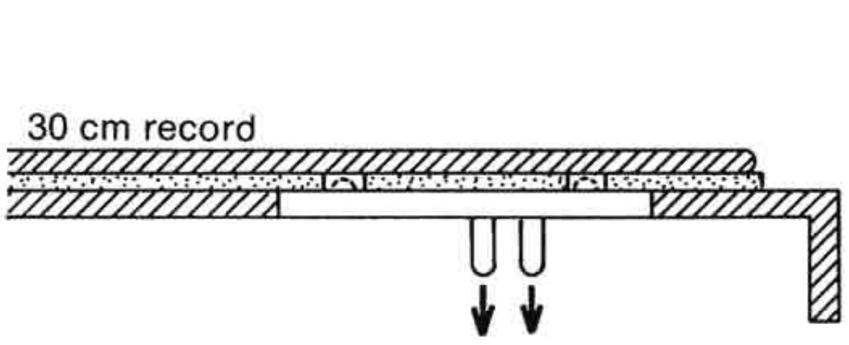
a) State of no record
Both of the 2 sensors are free and the detection pins are up.



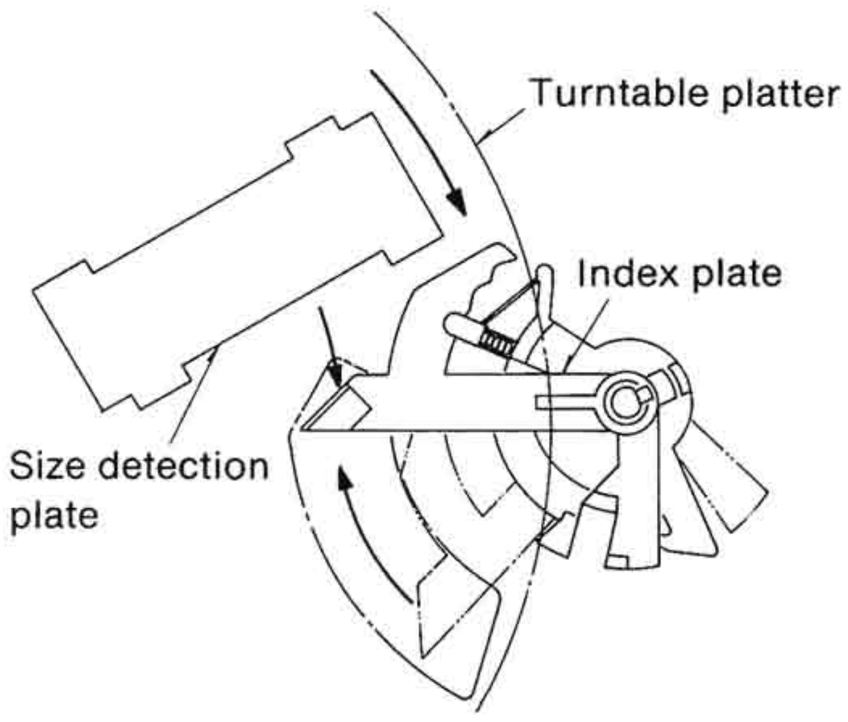
b) 17 cm record
The 17 cm record sensor is pressed by the record, and the inside detection pin is shifted down

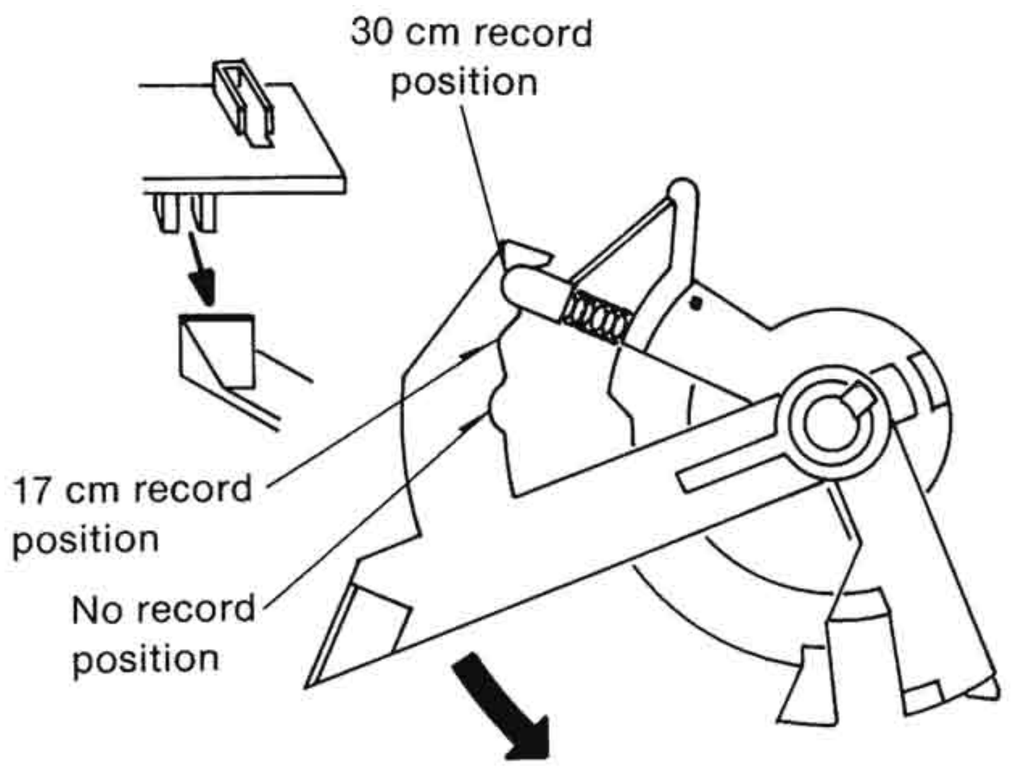


c) 30 cm record
Both of the 2 sensors are pressed, and the 2 detection pins are down.



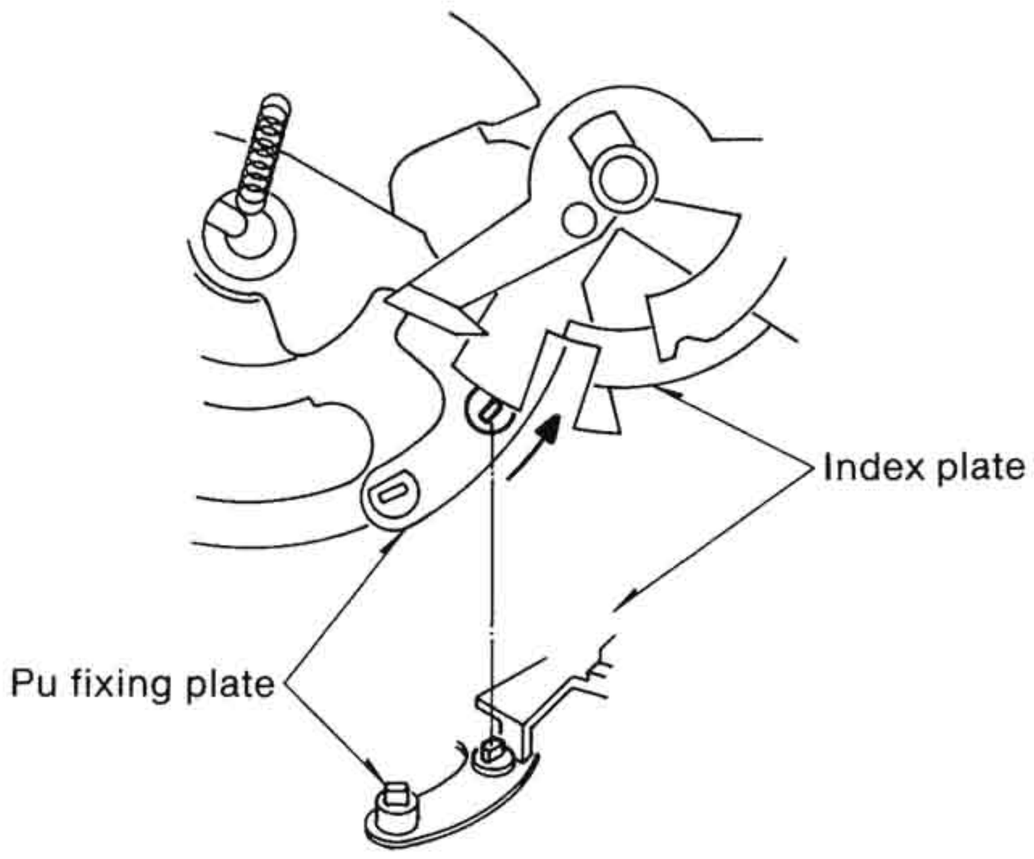
As the turntable platter starts rotating, the index plate is shifted from the initial position (broken line) to the solid line position by the arm mechanism. Since the detection pin of the turntable platter is as mentioned above, the detection pin does not touch the index plate When 17 cm record is present, the inside detection pin touches the index plate thereby setting the index plate to the position of 17 cm record When 30 cm record is present, both of the inside and outside detection pins come in touch with the index plate thereby setting the index plate to the position of 30 cm record.



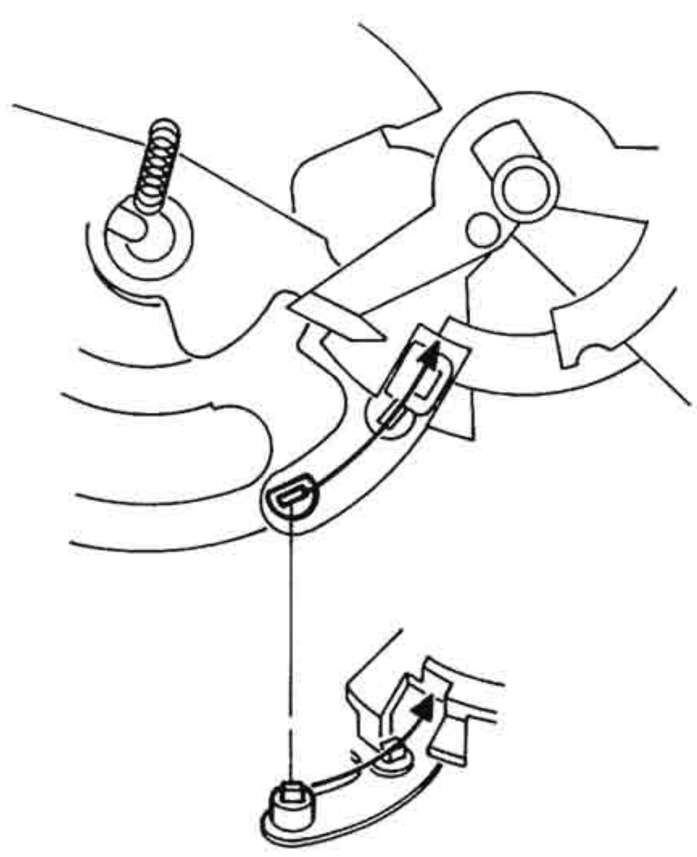


2. Drop position setting

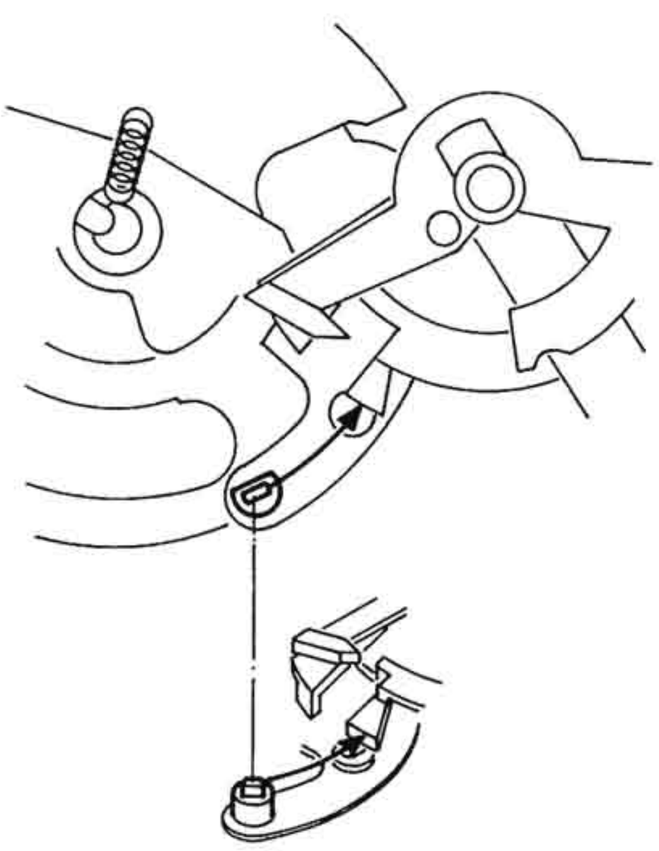
When the index plate is set with the record size detected, the tonearm drop position at auto start is determined. The PU fixing plate moves in auto start but its movement is limited as the drop position setting pin of PU fixing plate touches the index plate to set the drop position. The position then set is the tonearm drop position.



No record



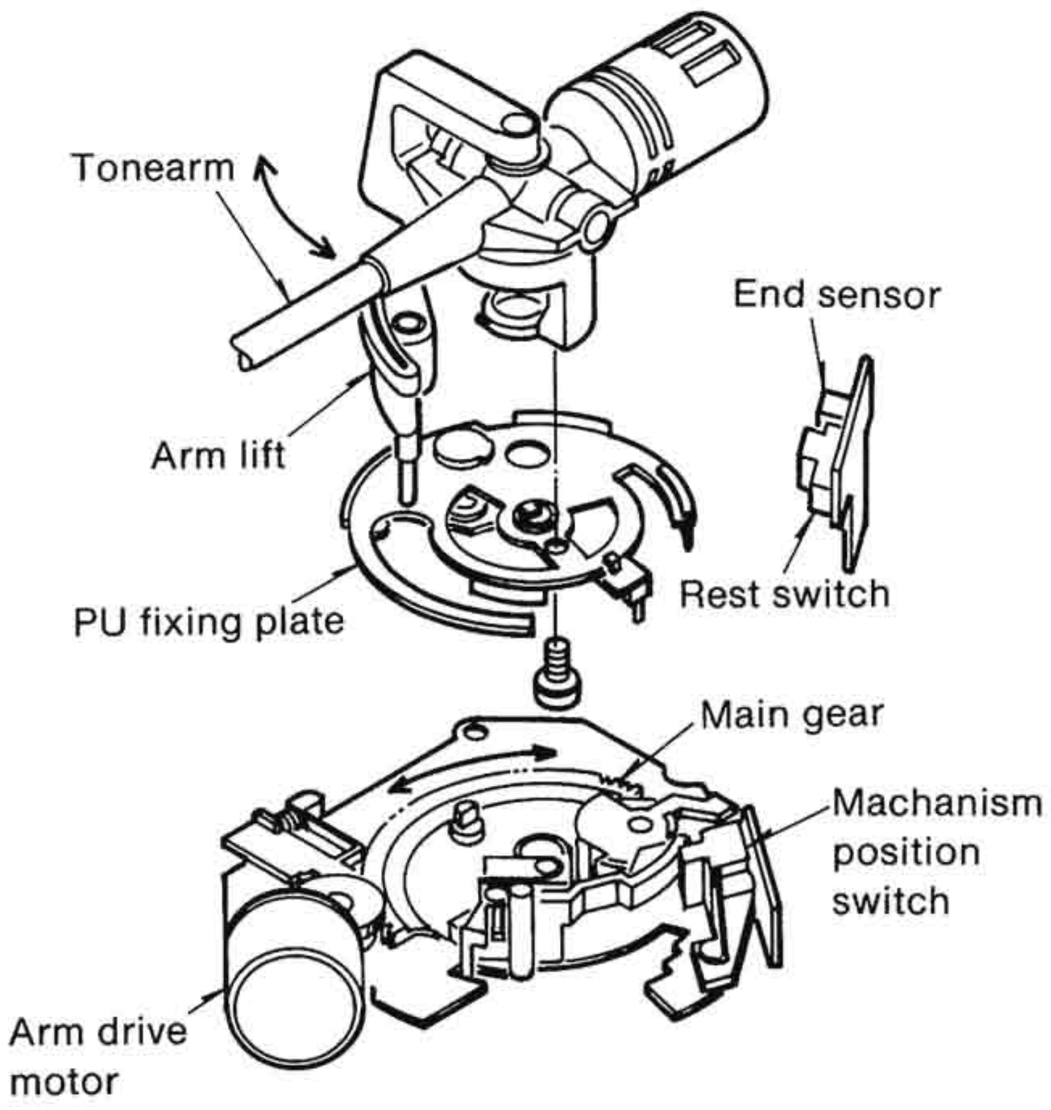
17 cm record

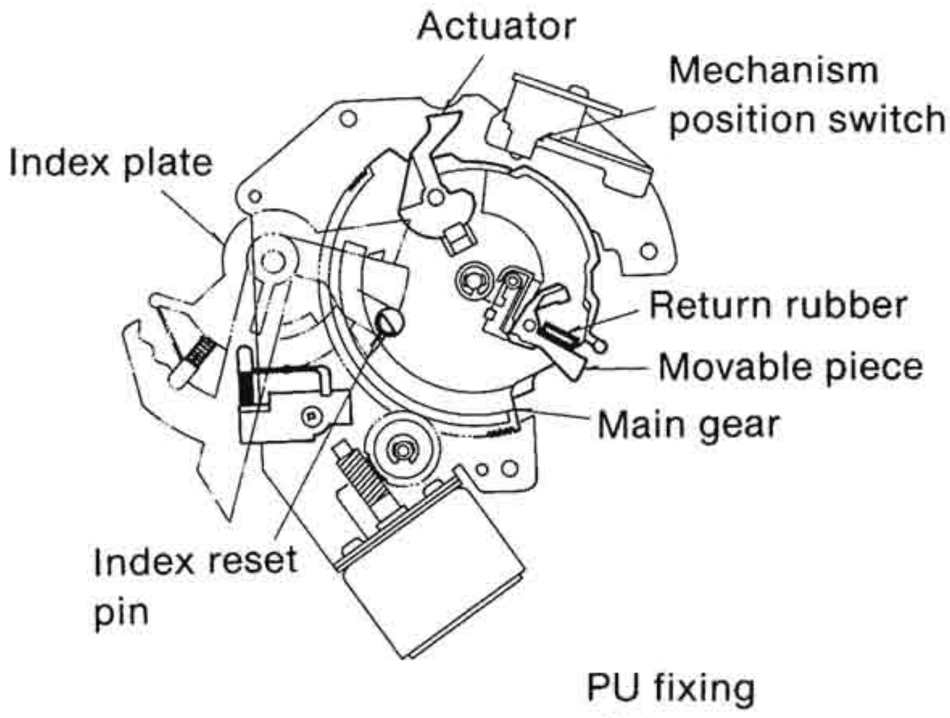


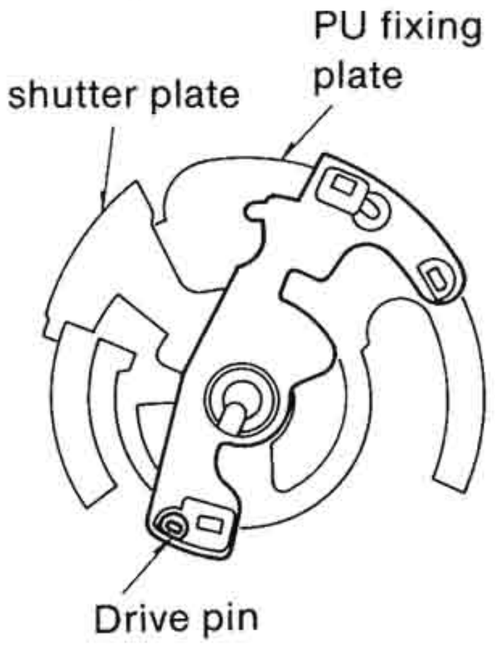
30 cm record

3. Mechanism of tonearm operation

The main gear is rotated by DC motor to perform cueing up/down, tonearm lead-in and return operations. Also, UP switch and DOWN switch are provided for the detection of mechanism operating position, and Rest switch, for the detection of tonearm rest position. The arm driving mechanism structure and the names of component parts are shown below.







a) Cueing operation

The lift rod is initially in the position of main gear **(Fig. A)** when cueing mode is "down". With the cueing key pressed, the motor rotates according to the command from the microcomputer to turn the main gear to the position of **Fig. B**. The main gear rotation causes the cueing mode to be shifted from "down" to "up". When the cueing key is pressed again, the motor reversely rotates according to the reversing command from the microcomputer, then the main gear returns to the initial position of **Fig. A**.

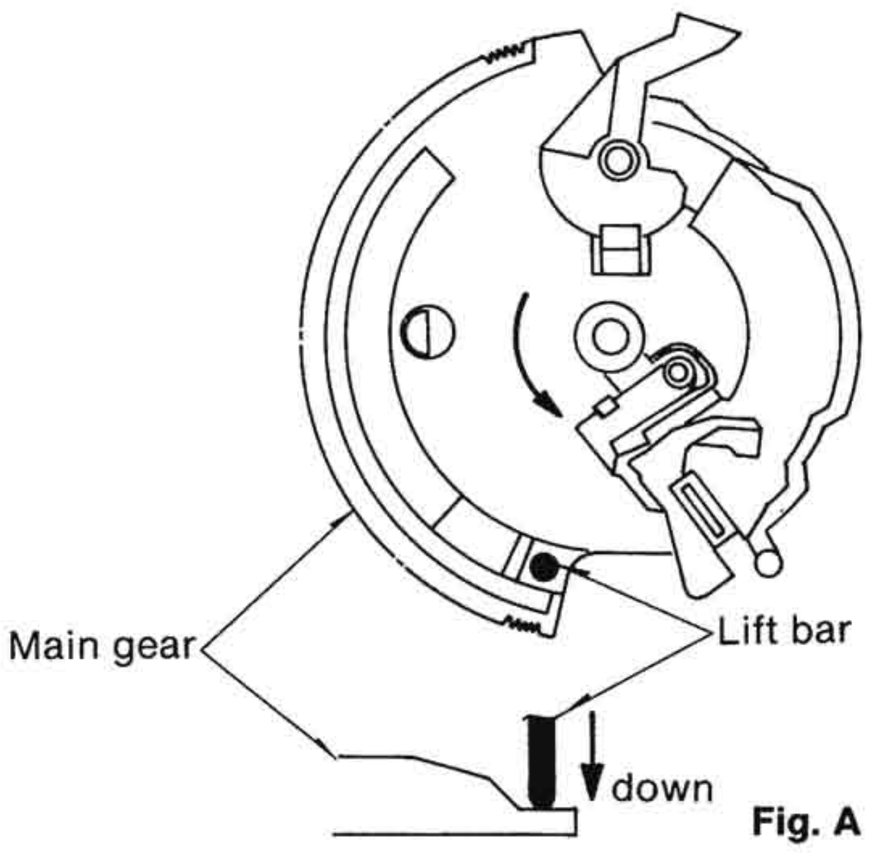


Fig. A

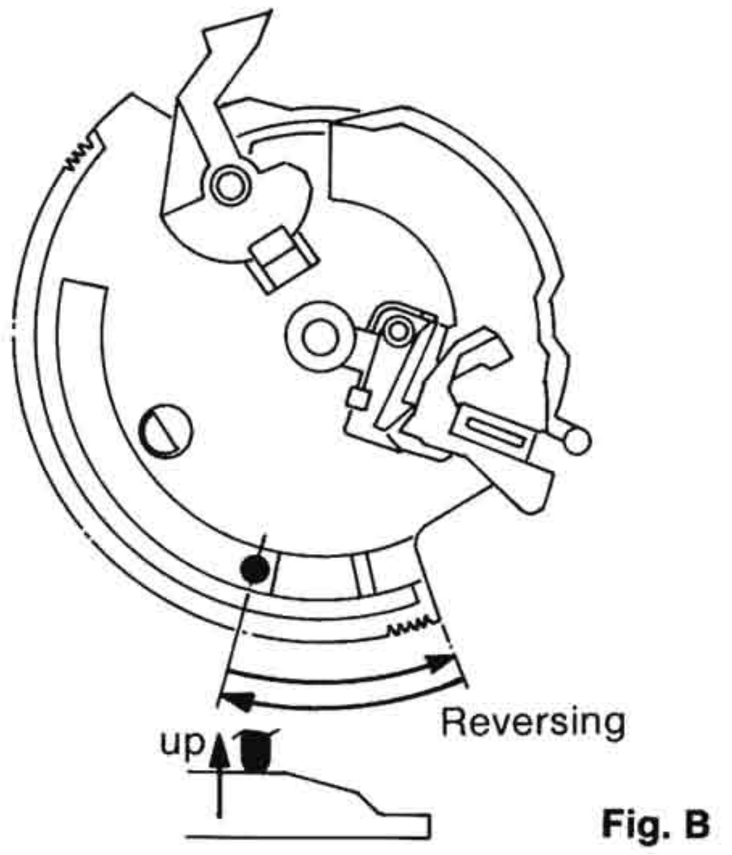

Fig. B

b) Stop operation

During play mode, the main gear is in the initial position **(Fig. A)**. With the stop key pressed, the motor rotates according to the command from the microcomputer to turn the main gear to the position of **Fig. C**. The rotation of main gear causes the cueing mode to be shifted to "up", and subsequently the return rubber pushes the drive pin of PU fixing plate to move the tonearm to the rest position. When the above operations have been completed, the motor reversely rotates according to the reversing command from the microcomputer, and the main gear returns to the initial position of **Fig. A**.

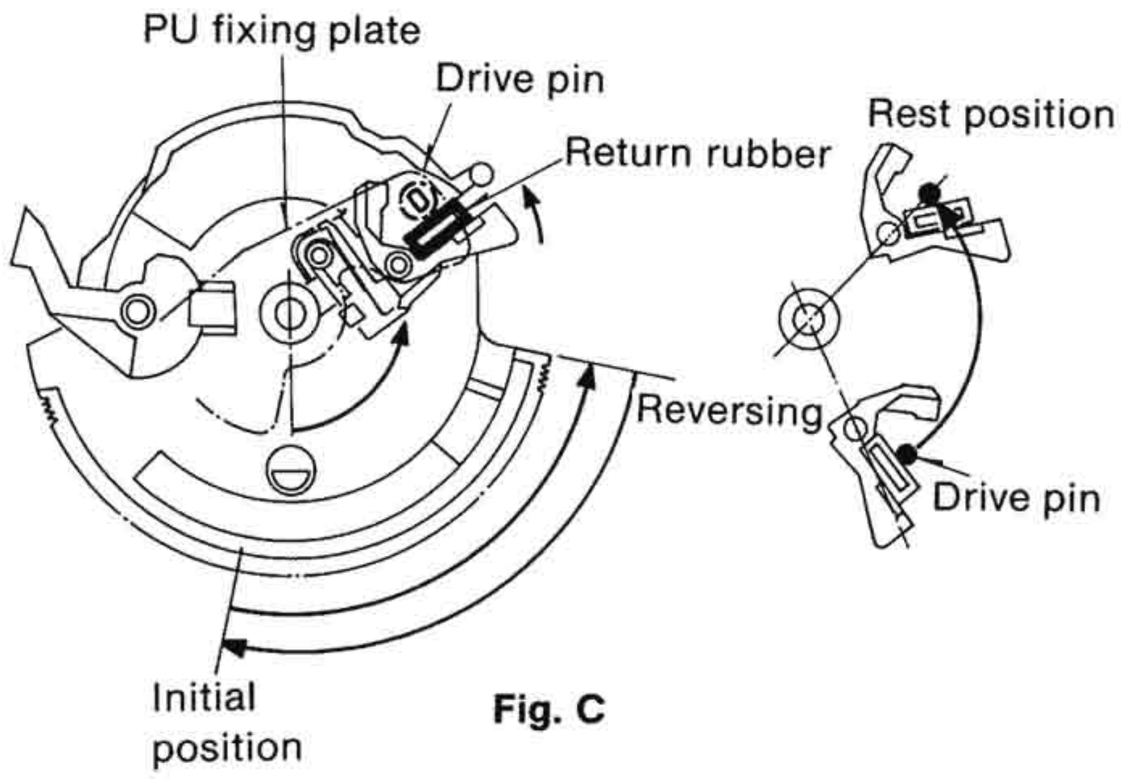

Fig. C

c) Auto start operation

When the start key is pressed, the motor rotates according to the command from the microcomputer to turn the main gear to the position of **Fig. D**. The rotation of main gear causes the cueing mode to be shifted to "up", then the mechanism is set so that the pin of movable piece touches the mechanism board to catch the drive pin of PU fixing plate located in the rest position. Also, it is set so that the record size can be detected by the index plate with the actuator of main gear. With the above operations completed, the motor reversely rotates according to the reversing command from the microcomputer to return the main gear to the initial position of **Fig. A**. In that case, the PU fixing plate moves along with main gear because the drive pin is set on the movable piece, while tonearm is moved inside, but with the record size detected, the drive pin is released from the movable piece at the record drop position since the index plate is set in place.

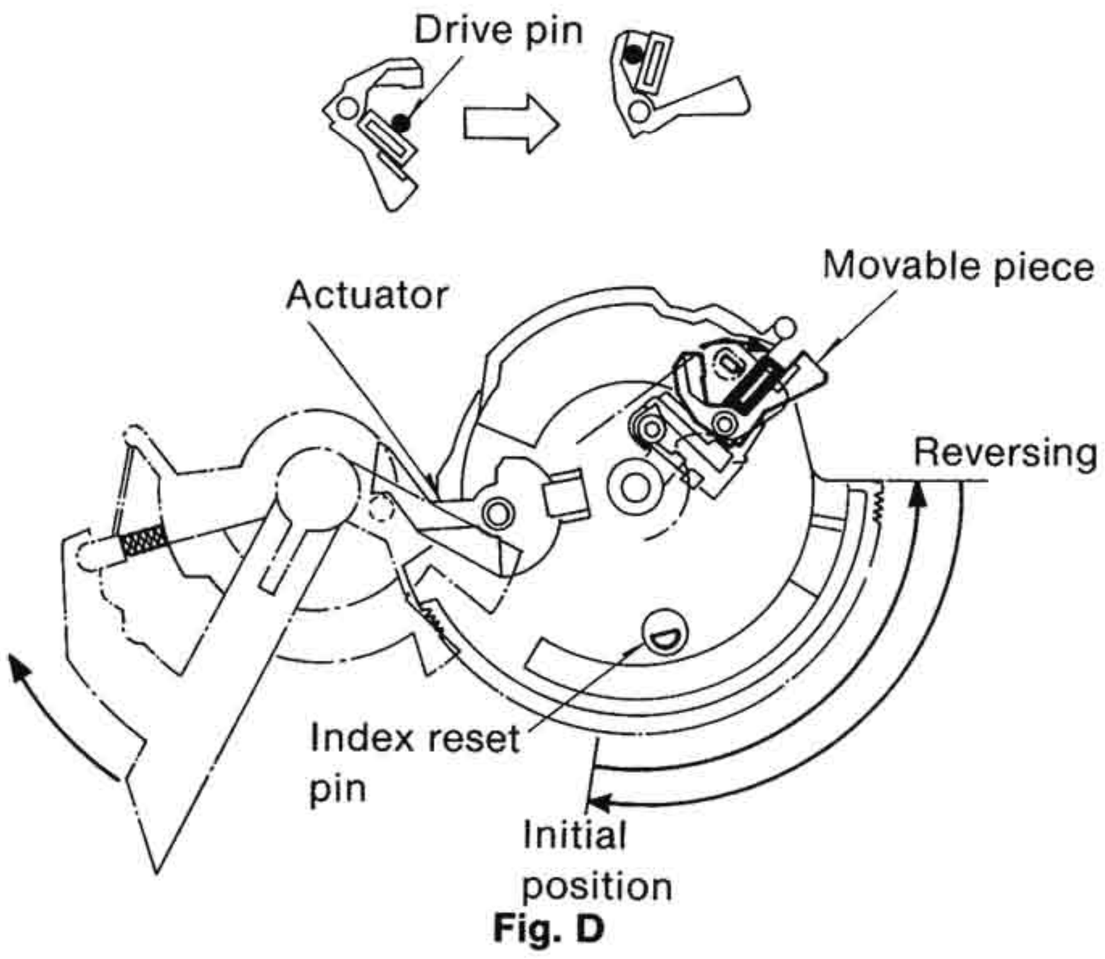

Fig. D

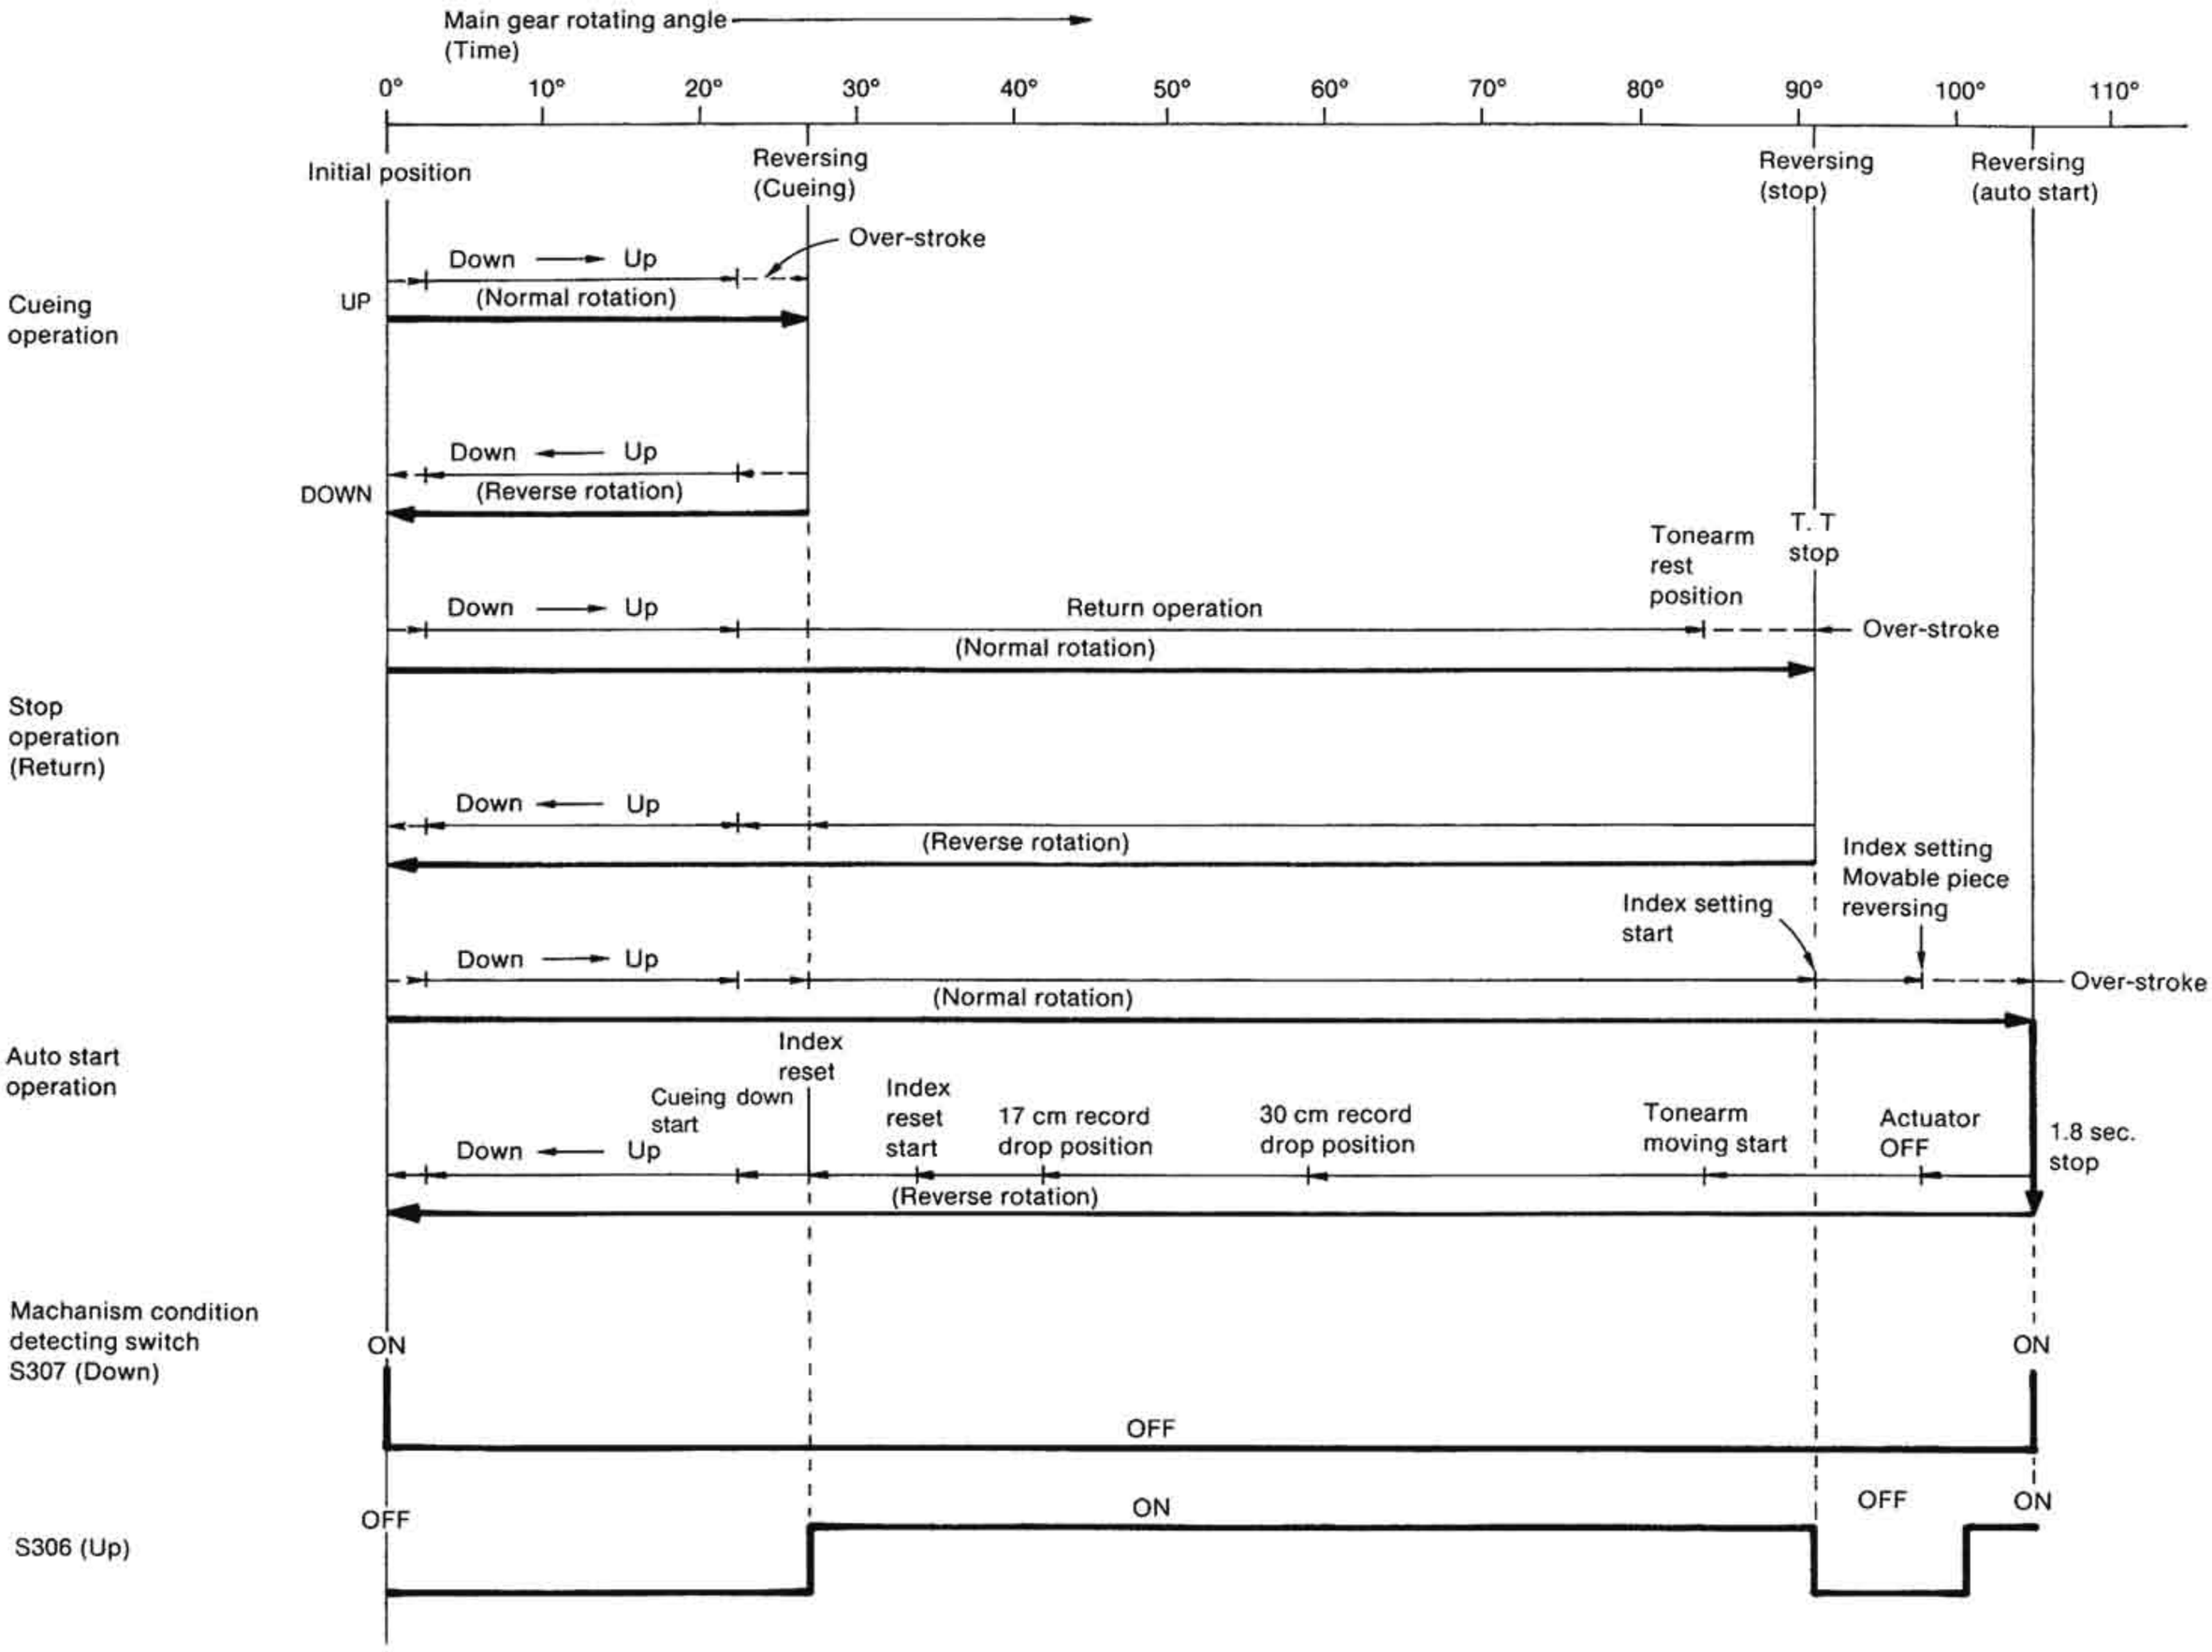
4. Auto mechanism timing chart

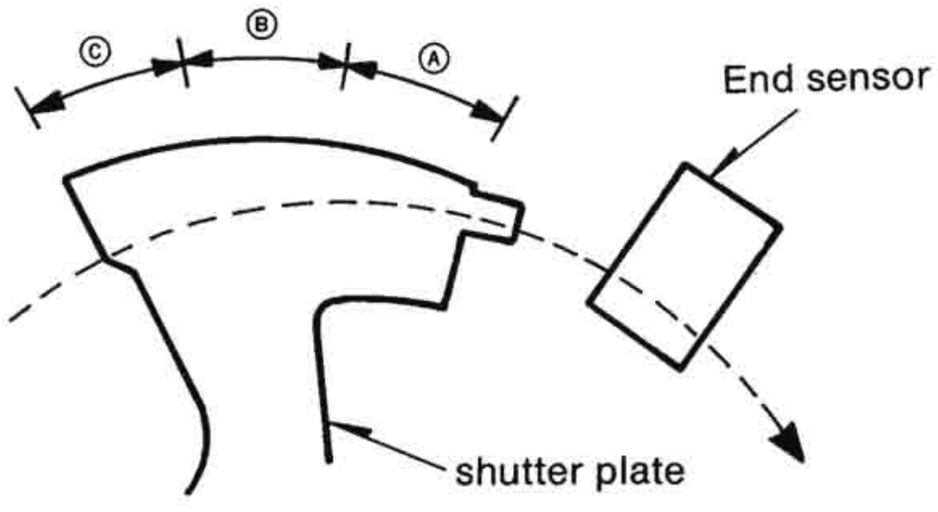


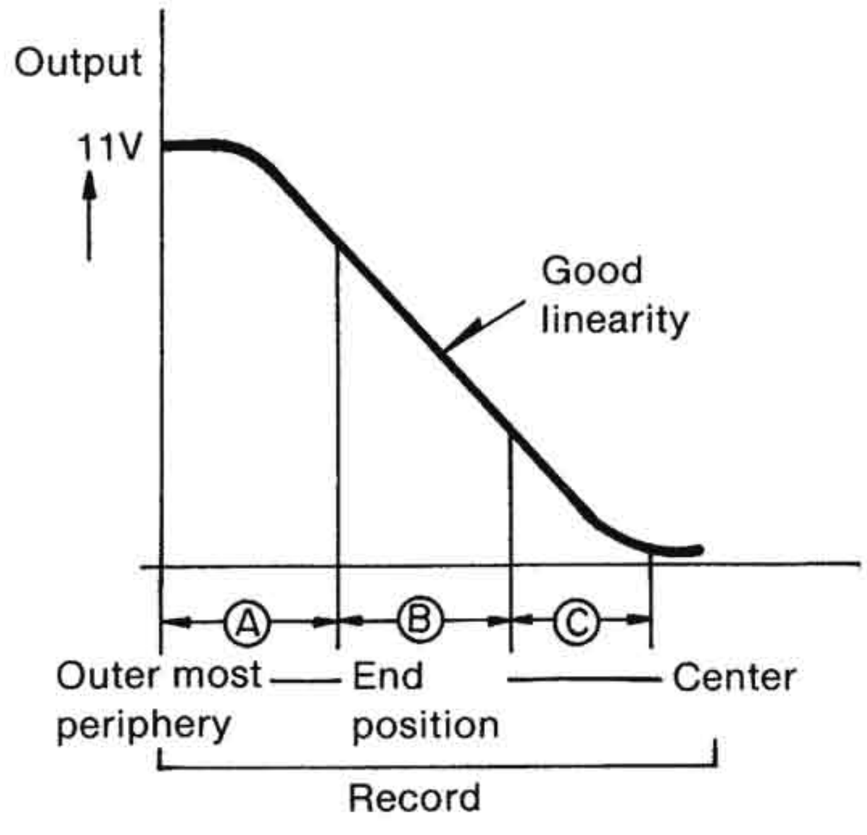
To detect the state of mechanism operation, a detection switch which turns ON/OFF with the rotation of main gear is installed as shown. With this switch operated, the state of mechanism is input to the microcomputer to give the normal or reverse rotation command to the motor.

Description of Circuit

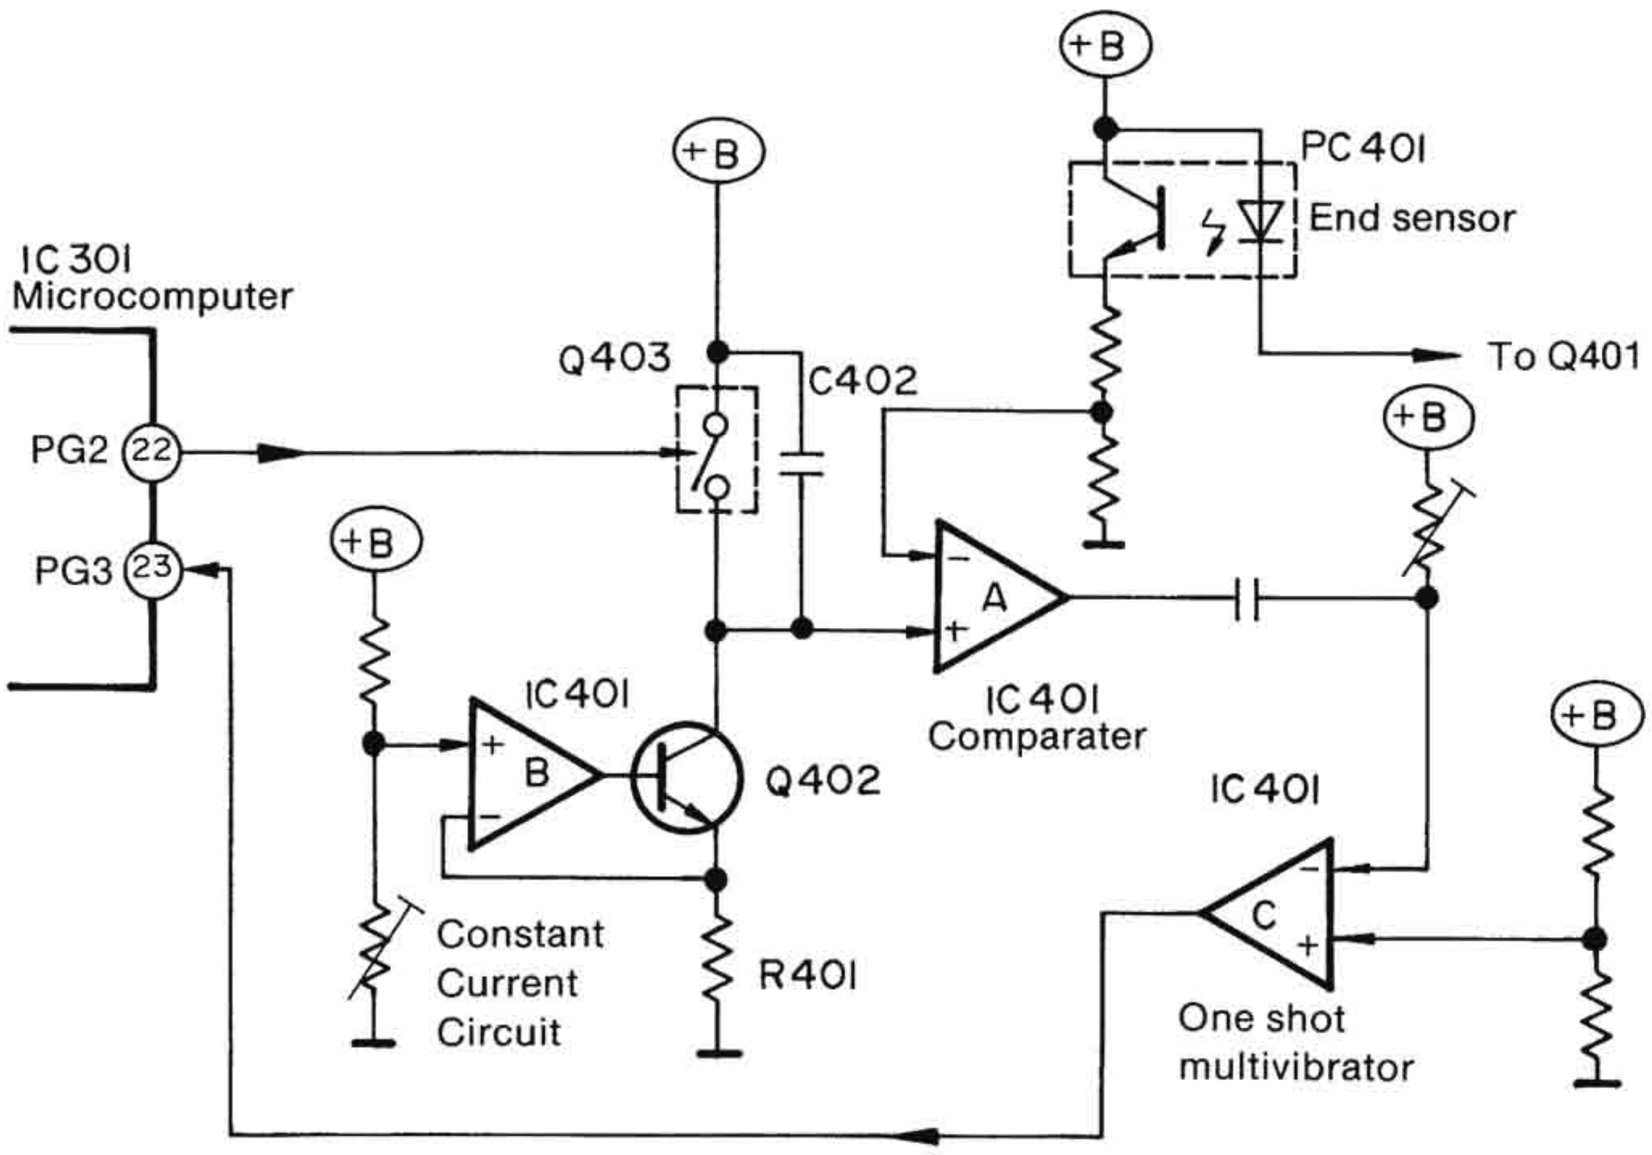
1. End detection sensor

It detects the output voltage change when the shutter plate installed under the tonearm passes through the end detection sensor. The shutter plate is not shaped in circular arc but in volution so that the output voltage changes linearly. The good linearity part of the characteristic is used as the range of end detection. (The actual range of detection is R65~R48 mm from the center of the record.)

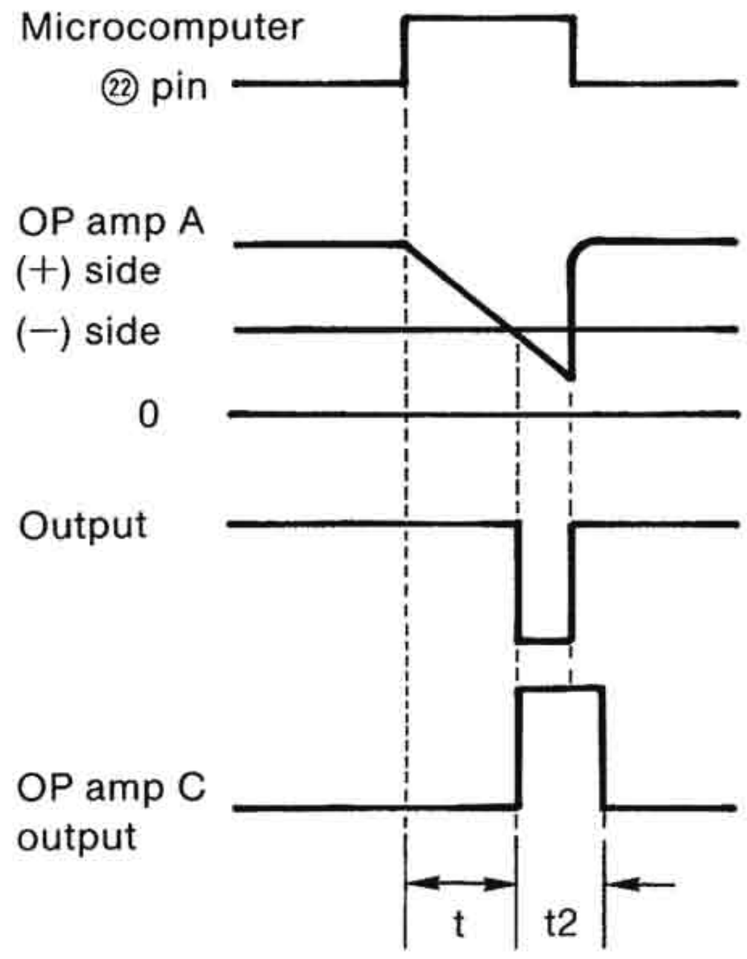




2. End detection circuit



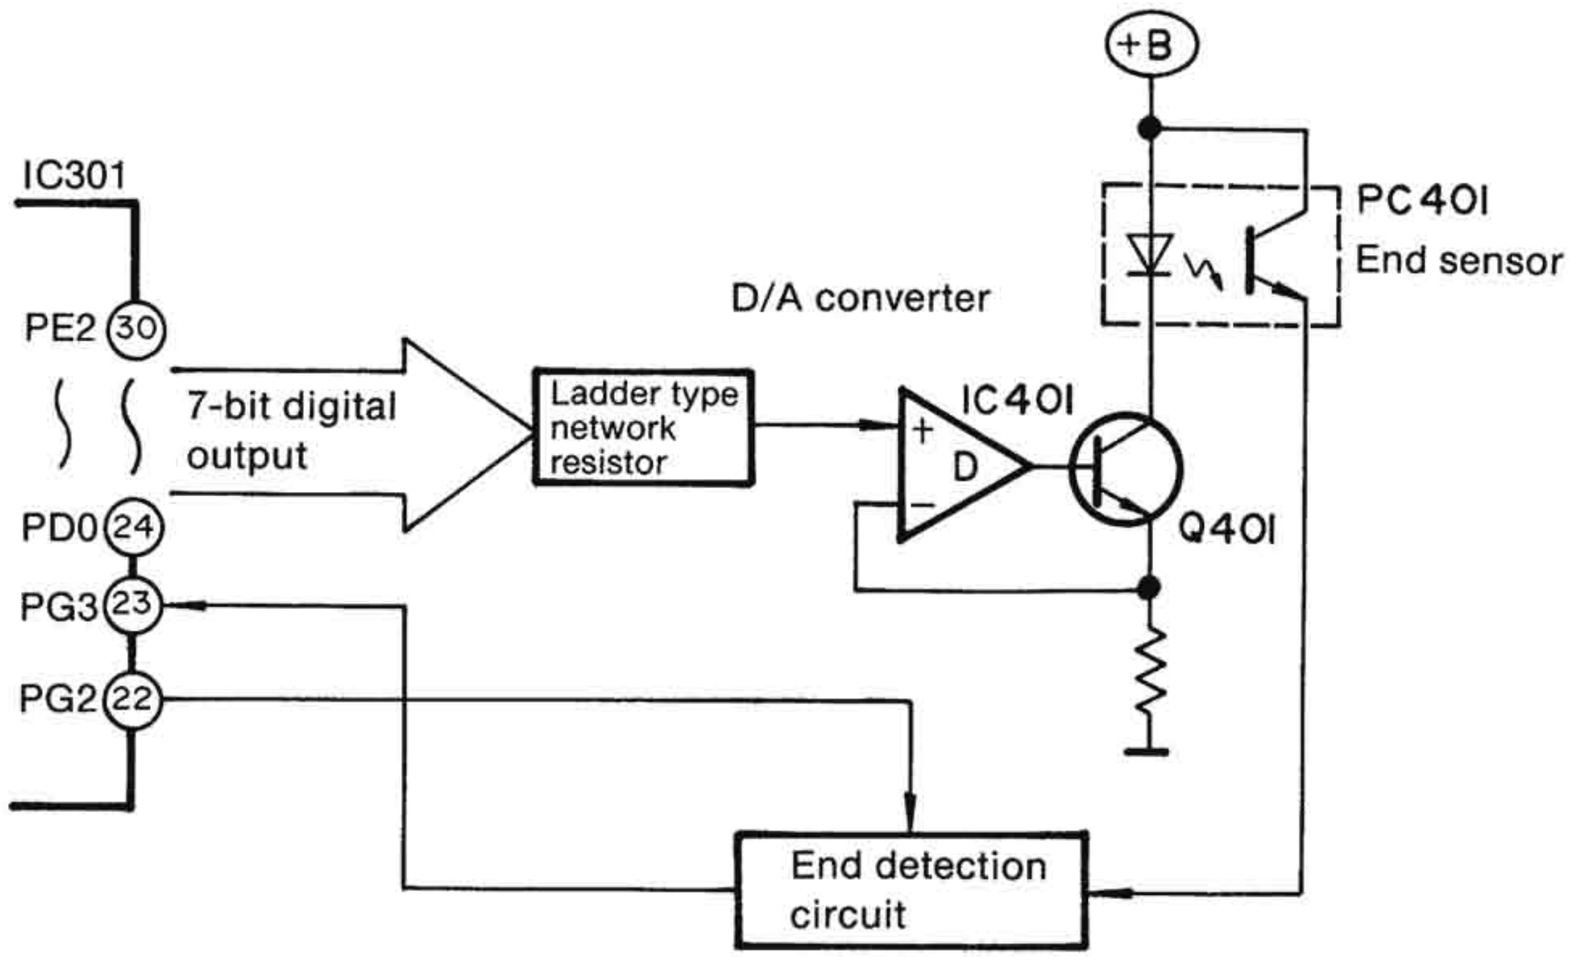
• Timing chart



Q403 repeats to turn on/off with the strobe output from pin 22 (PG2) of microcomputer (IC301). When the strobe of pin 22 is at "L", Q403 turns on, therefore (+B) is applied to the (+) side of OP amp A (IC401). When the strobe of pin 22 changes to "H", Q403 turns off and the voltage on the (+) side of OP amp A is lowered but the constant current circuit consisting of OP amp B and Q402 keeps the current flowing to R401 constant so that the voltage charged in C402 is discharged causing the (+) side voltage of OP amp A to gradually decrease. The voltage and the output of end detection sensor (PC401) are compared at OP amp A. The output of OP amp A goes "L" when the (+) side voltage is lower than the (−) side voltage. The output of OP amp A is input to the (−) side of one-shot multi-vibrator consisting of OP amp C. The output of OP amp C goes "H" at the rise of (−) side input. Using this circuit, the microcomputer reads the time (t) required until rise of the pulse input to pin 23 with the rise of the strobe of pin 22. Duty (t2) of output pulse of OP amp C is read by the microcomputer during the initial detection, which is the detection sensitivity. The wider the duty, the higher the sensitivity, and vice versa. The detection sensor is set so that the output changes in the range of end detection. Therefore, t is shorter when the output voltage is higher, and it is longer when the voltage is lower. Thus, the microcomputer is able to detect the tonearm position. Also, the amount of change in t can be found by reading the amount of t several times with the rotation of turntable platter, and therefore the tonearm advancing speed can be judged from the amount of change in t. In this way, the microcomputer detects the end of record to control the arm drive mechanism.

3. Automatic adjustment of end detection sensor output

In order to stabilize the operation point of end detection sensor after power ON, the output is automatically adjusted by the microcomputer so that the detection sensor output voltage becomes 11V while the tonearm is in the rest position and is returned to the rest position.



When the tonearm is in the rest position, 7-bit pulses are output from pins ㉔~㉚ of microcomputer, and the digital output is changed to analog output by OP amp D and D/A converter consisting of ladder type network resistor, thereby controlling the current flowing to LED of the detection sensor. In that case, strobe is output from pin ㉒ (PG2) of microcomputer, and the sensor output is detected by the end detection circuit mentioned in the previous section. The microcomputer outputs 7-bit pulses until the detected output becomes 11V thereby automatically adjusting the output of detection sensor.

■ DESCRIPTION OF IC301 (SVILC6526CPA) TERMINALS

Pin No.	Mark	Description
1	PE3	Turntable start/stop command output terminal ("L" at start, "H" at stop.)
2	VDD	Power supply terminal (+5V)
3	PF0	Mechanism condition detecting switch (Down SW) input terminal. (Mechanism condition is detected in up switch combination.)
4	PF1	Mechanism condition detecting switch (Up SW) input terminal. (Mechanism condition is detected in down switch combination.)
5	PF2	Full-auto mechanism and semi-auto mechanism mode changeover terminal. [Open...full-auto (SL-QD33), Ground...semi-auto (SL-QD22).]
6	PF3	Tonearm rest position detecting switch input terminal. ("L" with tonearm is rest position.)
7	PG0	45 LED lighting output and speed changeover command output terminal (LED lights up at "L", 45 r.p.m...."L", 33 r.p.m...."H".)
8	PG1	REPEAT LED lighting output terminal. (LED lights up at "L").. .full-auto (SL-QD33)
9	PG2	CUEING LED lighting output terminal. (LED lights up at "L".)
10	PG3	START/STOP LED lighting output terminal. (LED lights up at "L".)
11	PA0	Speed select key input terminal. (Used in full-auto mode.) 33 key input terminal. (Used in semi-auto mode.)
12	PA1	Repeat key input terminal. (Used in full-auto mode.) 45 key input terminal. (Used in semi-auto mode.)
13	PA2	Cueing key input terminal.
14	PA3	Start/stop key input terminal. (Used in full-auto mode.) Stop key input terminal. (Used in semi-auto mode.)

Pin No.	Mark	Description
15	OSC2	Clock oscillation input terminal. (800 kHz)
16	OSC1	Clock oscillation input terminal. (800 kHz)
17	TEST	Test terminal (Not used, connected to ground.)
18	VSS	Ground terminal
19	REST	Reset terminal (Microcomputer is reset at "L".)
20	PG0	Tonearm motor drive control output terminal.
21	PG1	
22	PG2	Strobe output terminal. (Strobe is output during detection sensor automatic output adjustment and end detection.)
23	PG3	Detection sensor automatic output adjustment and end detection input terminal. (It reads the time from rise of strobe of PG2 until rise of pulse input during automatic adjustment and end detection.)
24	PD0	LSB
25	PD1	7-bit digital output terminal.
26	PD2	
27	PD3	(7-bit pulses are output to LED of detection sensor until the output of detection sensor becomes 11V with the input of PG3.....Automatic output adjustment of detection sensor.)
28	PE0	
29	PE1	
30	PE2	MSB

Part	Motor conditions			
	Braked	Free	Normal	Reverse
PG0	H	L	L	H
PG1	H	L	H	L

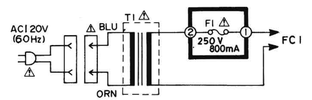
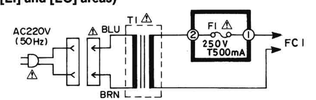
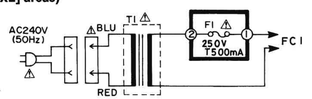
Product for Canada ([MC] area)



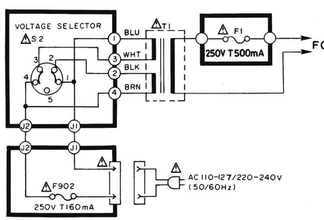
Product for Continental Europe ([E], [EG], [EH], [EF], [EI] and [EC] areas)

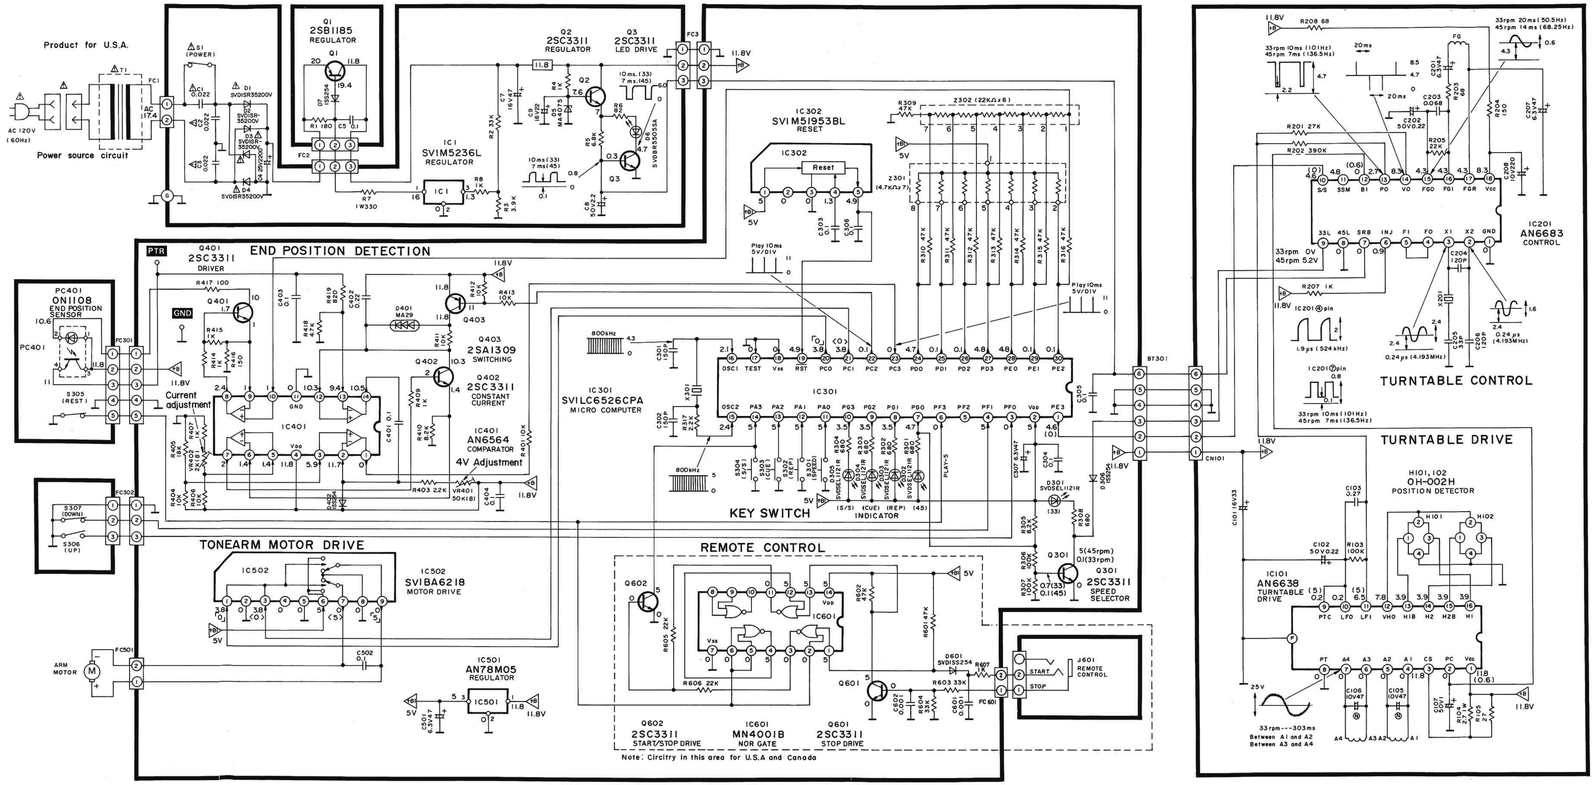


Product for United Kingdom and Australia ([EK] and [XL] areas)



Product for Other area ([XA] area)





Notes:

1. S1 : Power switch in "**on**" position.
2. S2 : Voltage selector switch in "**220-240V**" position. (For [XA] area only)
3. S301 : Speed select switch.
4. S302 : Repeat switch.
5. S303 : Cueing switch.
6. S304 : Start/stop switch.
7. S305 : Rest position detection switch in "**on**" position. (Tonearm is in the rest position.)
8. S306 : Mechanism position detection (up) switch in "**off**" position. (Tonearm is in the rest position.)
9. S307 : Mechanism position detection (down) switch in "**on**" position. (Tonearm is in the rest position.)
10. The voltage value and waveform are the standard values (stop mode) of this measured by DC electronic voltmeter (high impedance) and oscilloscope on the basis of chassis. Therefore, the voltage value and waveform may include some error due to the internal impedance of the tester or the measuring unit.
    - * ⌐ ¬ is the voltage when turntable is in rotation.
    - * ⌐ _ is the voltage when arm motor is in normal rotation mode.
    - * < > is the voltage when arm motor is in reverse rotation mode.
11. Important safety notice: Components identified by ⚠ mark have special characteristics important for safety. When replacing any of these components, use only manufacturer's specified parts.

Caution!

IC and LSI are sensitive to static electricity. Secondary trouble can be prevented by taking care during repair.

- Cover the parts boxes made of plastics with aluminum foil.
- Ground the soldering iron.
- Put a conductive mat on the work table.
- Do not touch the legs of IC or LSI with the fingers directly.

• **Product for MC only**

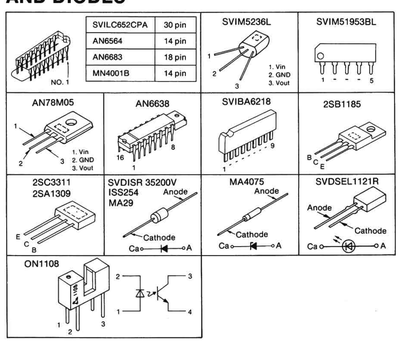
FUSE REPLACEMENT

Symbol located near the fuse indicates fast operating type. For continued protection against fire hazard, replace with same type fuse. Refer to the symbol for fuse rating.

FUSIBLE REMPLACEMENT

Le symbole qui se trouve près du fusible singifie un fusible à action rapide. Pour une protection continue contre les risques d'incendie, n'utiliser que des fusibles du même type. Se rapporter au symbole pour la vâleur des fusibles.

■ TERMINAL GUIDE OF IC'S, TRANSISTORS AND DIODES



■ REPLACEMENT PARTS LIST

Notes:

1. Part numbers are indicated on most mechanical parts. Please use this part number for parts order.
2. Important safety notice:
   Components identified by ⚠ mark have special characteristics important for safety.
   When replacing any of these components, use only manufacturer's specified parts.
3. Ⓚ-marked parts are used for black type only, while ◯-marked parts are for silver type only.
4. Parts other than Ⓚ-and ◯-marked are used for both black and silver type.
5. Bracketed indications in Ref. No. columns specify the area. Parts without these indications can be used for all areas.
6. The "Ⓢ" mark is service standard parts and may differ from production parts.
7. The parenthesized numbers in the column of description stand for the quantity per set.

   Unless otherwise specified.
   All resistors are in OHMS (Ω) K=1000Ω, M=1000kΩ
   All capacitors are in MICROFARADS (μF), P=10^{-6}μF.
