## LOCATION OF CONTROLS

- The power supply for this unit varies depending upon the areas. Also, the parts used for power supply are different. So, refer to the circuit diagram and the replacement parts list.
- \* 220V (50/60Hz) for continental Europe.
- \* 240V (50/60Hz) for United Kingdom and Australia.
- \* 110V/120V/220V/240V (50/60Hz) for other areas.
- [XA area] for other areas is provided with voltage selector and AC outlets.
- \* Phono input capacitance is about 150pF.

**BEFORE REPAIR AND ADJUSTMENT**

Turn off the power supply and short-circuit both ends of power supply condensers (C501, 502, 6800 $\mu$ F) at resistance (about 10 $\Omega$ , 5W) in order to discharge the charged voltage. Avoid short-circuit with a screwdriver or the like, otherwise the transistors or diodes may break down.

Before turning on the power supply after completion of repair, slowly apply the primary voltage by using a voltage regulator to make sure that the current consumed is free of abnormality. The current consumed at 60Hz/50Hz in no-signal mode is shown below with respect to supply voltage 110V/120V/220V/240V.

Power supply voltage		AC 110V	AC 120V	AC 220V	AC 240V
Current consumed	50Hz	220 ~ 440mA	200 ~ 400mA	110 ~ 220mA	100 ~ 200mA
	60Hz	200 ~ 400mA	180 ~ 360mA	100 ~ 200mA	90 ~ 180mA

**Caution**

\* When the power transformer has been replaced, attach the thermistor (100k $\Omega$ ) to the cover of power transformer by using the thermistor retainer, and secure it with adhesive.

\* How to fix the thermistor. The thermistor is covered with insulating tube, as illustrated, to prevent shortcircuit.

## TECHNICAL GUIDES

### 1. SPEAKER IMPEDANCE DETECTION CIRCUIT

This circuit detects the impedance of the speaker connected to the speaker terminal and serves to keep the operation of the unit in best conditions, controlling the constant voltage power supply circuit. It consists of a "voltage comparing circuit", "reset circuit", "detection signal generating circuit" and "relay drive circuit".

#### ① Basic principles

The built-in reset switch is short-circuited only for a moment when speaker selector is operated.

(Fig. 1-A) Simultaneously, the reset circuit operates (Fig. 1-B) to turn both RLY 301 and RLY 302 OFF.

Subsequently, the reset switch opens at the end of operating the speaker selector. Then, the detection signal generating circuit keeps RLY 301 OFF for 0.5 second more. (Fig. 1-C) Since RLY 301 is OFF, the speaker connected to speaker terminal contacts with the voltage comparing circuit. The difference from the reference voltage, that is, the type of speaker connected, is detected; and the secondary side tap voltage of the power transformer is switched by RLY 301 so that the voltage matches the connected speaker.

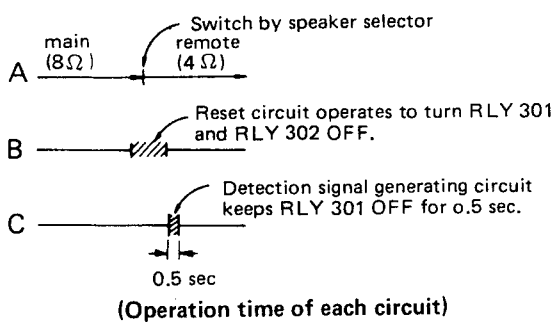

Fig. 1

Fig. 2

#### ② Reset circuit and detection signal generating circuit

As already explained, when the reset switch is short-circuited, Q305 in the reset circuit turns ON. Positive voltage is generated at the collector of Q305 as shown in Fig. 3-A, causing Q302 in the relay drive circuit [I] to turn ON. (But, the base of Q302 is usually at 0 volt and OFF.)

When Q302 turns ON, the base of Q301 is grounded and turns OFF, causing RLY 301 to turn OFF. Also, the collector voltage of Q301 becomes positive, causing Q306 as well as RLY 302 to turn OFF. (Q301 emitter is connected to pin ⑥ of IC401 and the voltage of this pin is usually zero or a little positive.) In other words, RLY 301 and RLY 302 are OFF while the reset switch is short-circuited.

Also, at the moment when the reset switch opens, the voltage as in Fig. 3-B is applied to the base of Q304 in the detection signal generating circuit which uses a multi-vibrator due to the charge and discharge of C301, thus causing this transistor to turn ON.

And voltage as in Fig. 3-C is generated at the collector. The voltage in Fig. 3-C turns Q302 ON, and Q301 OFF, therefore both RLY 301 and RLY 302 turn OFF. RLY 301 and RLY 302 are OFF for 0.5 second. That is, RLY 301 and RLY 302 are turned OFF during shortcircuit of the reset switch and for 0.5 sec. more after opening of the switch.

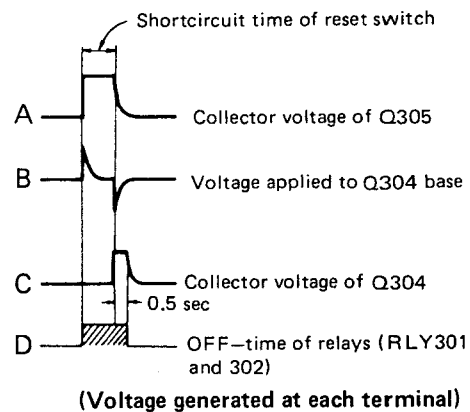

Fig. 3

(Speaker impedance detection circuit)  
Fig. 4

③ Voltage comparing circuit

While the relay (RLY302) is OFF, the speaker is in contact with the voltage comparing circuit. (Fig. 5)  
The reference voltage is applied to the negative input terminal of operation amplifier (IC301), and the voltage of positive input terminal varies depending on the speaker impedance as shown in Fig. 5. The alteration of voltage is directly related with the output of operation amplifier. Usually the unit is adjusted so that the output voltage is zero with 6Ω speaker connected, and the output voltage of operation amplifier becomes negative with 4Ω speaker connected, and the output voltage becomes positive with 8Ω speaker connected. Only when the voltage is negative, Q306 and RLY 302 turn ON, switching the secondary side tap voltage of power transformer to 28.7V.  
Incidentally, when 8Ω speaker is connected to Rch and 4Ω to Lch, negative voltage is generated.

Fig. 5

④ Voltage comparing circuit and reset circuit

The operation amplifier of "voltage comparing circuit" holds the detected impedance 8Ω or 4Ω. Therefore, if a speaker of different impedance is connected, it is necessary to turn off the power supply or switch the speaker selector and to operate the reset circuit. That is, the relays (RLY301 and 302) must be turned OFF.

## PROTECTION CIRCUITRY

The protection circuitry may have operated if either of the following conditions is noticed:

- No sound is heard when the power is turned on.
- Sound stops during performance.

The function of this circuitry is to prevent circuitry damage if, for example, the positive and negative speaker connection wires are "shorted", or if speaker systems with an impedance less than the indicated rated impedance of the amplifier are used.

If this occurs, follow the procedure outlined below:

1. Turn off the power.
2. Determine the cause of the problem and correct it.
3. Turn on the power once again.

**Note:**

When the protection circuitry functions, the unit will not operate unless the power is first turned off and then on again.

## RESISTORS & CAPACITORS

- Notes:**
1. Part numbers are indicated on most mechanical parts. Please use this part number for parts orders.
  2. Important safety notice:  
Components identified by  $\Delta$  mark have special characteristics important for safety. When replacing any of these components use only manufacturer's specified parts.

3. Bracketed indications in Ref. No. columns specify the area. Parts without these indications can be used for all areas.
4. The "S" mark is service standard parts and may differ from production parts.
5. Unless otherwise specified.  
All resistors are in OHMS ( $\Omega$ ) K = 1000 $\Omega$ , M = 1000k $\Omega$   
All capacitors are in MICROFARADS ( $\mu$ F) P =  $\mu$ F

- Brancher un oscillateur à basse fréquence à la borne de sortie du tuner et une résistance de charge de 8 ohms et un voltmètre électronique à la borne de l'enceinte.
- Par l'oscillateur à basse fréquence, appliquer un signal de 1 kHz à l'appareil.
- Régler le volume du son au maximum.
