■ DISASSEMBLY PROCEDURES

1. Top cover removal

Remove screws ① to ③ in photo 1 from both right and left sides then remove the top cover.

- ① ~ ② : B.W. head screw
- ③ : Bind head tapping screw

Photo 1

2. Bottom cover removal

Remove screws ① to ⑤ in photo 2 and then remove the bottom cover.

- ① ~ ⑤ : Bind head tapping screw

Photo 2

3. Front panel removal

a. Loosen the set screws of REC OUT, and Input knobs with a 1.5 mm hexagon wrench, then pull out each knob.

b. Remove screws ⑥ and ⑦ in photo 2 as well as screws ① and ② in photo 3 and then remove the front panel.

- ① - ② (photo 3) ⑥ - ⑦ (photo 2): Bind head tapping screw

Photo 3

4. Power transistor replacement

a. Remove screws ① to ④ in photo 4.

- ① ~ ④ : Bind head tapping B tight screw

Photo 4

b. Remove screws ③ to ⑥ in photo 3 and remove the heat sink.

- ③ ~ ⑥ : B.W. head tapping screw

c. Detach the soldering of the power transistor and then replace the power transistors.

d. When mounting power transistors, screw power transistors putting mica base between the heat sink and the transistors. Be sure that the heat sink should not be touched to the case of the power transistor. When isolation between power transistors and the heat sink is imperfect, the circuit is occurred.

Apply silicon grease to both sides of the mica base so that heat coupling between power transistors and the heat sink should be tight.

Fig. 1

5. Main printed circuit board removal

- a. Remove the Top cover, Bottom cover and Front panel according to foregoing steps 1 to 3.
- b. Pull out lamps ① to ⑤ in photo 5.
① ~ ⑤ : Pilot lamp
- c. Remove the remote switch wire as shown in Fig. 2.
- d. Remove screws ① to ④ in photo 4 as well as screws ⑥ to ⑨ in photo 5 and then remove the heat sink.
① ~ ④ (photo 4): Bind head tapping B tight screw
⑥ ~ ⑨ (photo 5): B.W head tapping screw
- e. Detach the lead wires which are connected to the main printed circuit board.

- f. Pull out the stopper ① with pliers upwards.
- g. Remove nuts ② to ⑦ in photo 6.
- h. Remove screws ⑩ to ⑬ in photo 5.
⑩ ~ ⑬ : B.W. head tapping screw
- i. Remove screws ① to ⑩ in photo 7.
① ~ ⑩ : Bind head tapping screw
- j. Remove screws ⑪ to ⑮ in photo 7.
Remove rear panel and then remove main printed circuit board.
⑪ ~ ⑮ : Bind head tapping screw

ADJUSTMENTS

1. Idling current

When repairing the main amplifier (replacing TR105 to 122), adjust idling current.

- Set the VOLUME control to its lowest position.
- Rotate VR109 (L ch) and VR110 (R ch) for idling current adjustment fully counterclockwise.
- Connect a voltage tester to the test points.
(L ch: TP1 ⊕ ~ TP2 ⊖, R ch: TP3 ⊕ ~ TP4 ⊖)
- After the power has been switched, rotate VR109 and VR110 and set so that the voltage between test points comes to 20mV.
- Set so that the voltage between test points comes within $20 \pm 4\text{mV}$ about 3 or 4 minutes after the power has been switched on to enable the operation of the amplifier to stabilize.

* When idling current rises abnormally and the voltage of test points is very high, in spite of rotating VR109 or VR110 counterclockwise, the set is broken.

2. DC offset

After the power switch is pushed on, wait 3 ~ 4 minutes before measuring, to be sure of the most stable operation.

- Check that idling current is within rating.
- Connect a voltage tester to the test points.
(L ch; TP1 ~ E, R ch; TP3 ~ E)
- Rotate VR107 (L ch) and VR108 (R ch) for DC offset and adjust so that the voltage between test points comes to 0V.

* Center voltage drifts within \pm a few milli volts across 0V. When center voltage drifts abnormally and transiently, the set is broken.

You will find that Adjustment will be facilitated if you use the lead wires as shown in the bottom figure.

Adjustment item	Channel	Test point	Adjustment VR	Rating or standard
Idling current adjustment	L ch	TP1 ⊕ ~ TP2 ⊖	VR109	20 ± 4 mV
	R ch	TP3 ⊕ ~ TP4 ⊖	VR110	
DC offset adjustment	L ch	TP1 ~ E	VR107	0 ± 10mV
	R ch	TP3 ~ E	VR108
